To Whom it is of concern,

I ask that the CEC work to adopt and implement a non discriminating, fully transparent, and simplified feed in tariff policy to encourage the rapid deployment of renewable energy sources.

I ask that the feed in tariff apply to the use and integration of residential/commercial renewable generation. This application would benefit rate pavers who may otherwise be reluctant to invest in this technology with current net metering policy as the only financial incentive.

It is clear that the Residential and Commercial roof top installation model has the added societal benefit, in that it makes efficient use of the existing transmission and distribution infrastructure. In the case of roof top PV, can reliably serve peak load.
The owners of these systems typically implement conservation strategies as well.

As has been demonstrated in other countries, the adoption of the feed in tariff has accelerated the development of renewable energy, more the RPS goals alone.

I commend and thank you for your consideration.

Sincerely, Ron Dickerson
