

To whom this may concern,

I am aware that two power plants might be built in Hayward and Calpine, which is the company who is planning to build these establishments, is willing to spend money to help homeowners with fireplaces or wood burning stoves to change to alternative forms of heating. This is not environmentally safe in my opinion. To have not one but two power plants in the same city may cause great environmental damage to the city and its inhabitants. The California energy commission still has to approve the plans for this project in order for it to go through but I greatly suggest that not both of the plants be built and operated in Hayward. If one plant was to be located in another city or county then I might consider being for the project after I have looked at the ratings on the pollution and efficiency. As I see now a lot of people are going to be in disagreement with the plans that have been made for Hayward. If these plans actually go through I assume that a lot of people will be upset. Also I am pretty sure that the price of housing will go down significantly due to the polluting power plants. These factors will greatly add to the residents being upset. Overall, the plans intended for Hayward are not environmentally safe. If alternatives plans were to arise I believe that Hayward residents would be more supportive of the plan but since not one but two power plants are planned to be built on Hayward all I can say is that I and all the people I am associated with are not in agreement and will try our best to find alternative ways to come to some agreement.

Sincerely,
William Gracia
