COMMISSIONERS PRESENT

- Charles R. Imbrecht, Chairman
- Barbara Crowley, Vice Chair
- Geoffrey D. Commons, Commissioner
- Warren D. Noteware, Commissioner

PUBLIC ADVISER'S OFFICE

- Ernesto Perez

STAFF PRESENT

- William Chamberlain, Staff Counsel
- Dorothy Dickey, Staff Counsel
- G. William Pennington
- Michael Messenger
- Ted Rauh

OTHERS PRESENT

- John Oyer
- Michael Gardner, Southern California Edison
- Emilio "Gene" Varanini
- S. L. Craig, Borg-Warner Central Environmental Systems, Inc.
- Joe McGuire, Air Conditioning & Refrigeration Institute
- Edward A. "Ted" Baily, Carrier Corporation
- Peter Miller, Natural Resources Defense Council

P R O C E E D I N G S

--oOo--

1
2
3 CHAIRMAN IMBRECHT: Let the meeting please
4 come to order. I ask you to all rise please and ask
5 Commissioner Noteware to lead us in the flag salute.

6 (FLAG SALUTE)

7 Okay we have an obviously very full agenda
8 ahead of us today. At a request of the Executive
9 Director, in which I concur in, we have tried to group
10 a number of contract items designated on a supple-
11 mentary agenda provided to members of the Commission as
12 Item A. I've been informed that Item 9 should be
13 withdrawn from that list. Also I should mention that
14 Item 8 has been withdrawn from the agenda completely.
15 Item 9 we will take up separately, I believe sometime
16 after our luncheon recess.

17 Since it's my anticipation that Item No. 1
18 will obviously entail a substantial amount of
19 testimony, I'd like to suggest that we turn, first, to
20 the so-called Item A (Designated Contracts) and see if
21 we can dispose of that before we turn the remainder of
22 the agenda.

23 For the purpose of the record, let me simply
24 indicate that those items are, first:
25

1 . Item 5 which is a contract for
2 \$23,262 with American Aerial
3 Surveys for acquisition of aerial
4 photography for the Gevers area.

5 . Item 6 which is an amendment to
6 an existing contact with the
7 California State University of
8 Chico to augment the existing
9 budget by \$4,699 for vegetation
10 mapping in the Geysers area.

11 . Item 10, which is a contract for
12 \$75,000 with ADM Associates to
13 revise and update the performance
14 approach computer programs,
15 associated user manuals, and
16 prescriptive approach compliance
17 manuals to include the new
18 Retail/Grocery Non-Residential
19 Building Standards.

20 . Item 11, contract for \$44,300
21 with the Association of Bay Area
22 Governments to develop standardized
23 training materials to be used in
24 training the building industry,
25

1 etc. with respect to the '82
2 Residential Building Standards.
3 . Item 16, a contract for \$33,333
4 each. That's actually three
5 contracts: one with the City of
6 Roseville, one with the City of
7 Pasadena and one with the County of
8 Marin with respect to the Home
9 Rating and Labeling project.
10 . Item 17, a contract for \$25,000
11 with the City of Roseville to
12 provide additional services under
13 that same program.
14 . Item 18, a contract for \$40,272
15 with Data General to renew the
16 Maintenance Agreement with respect
17 to our computer equipment here at
18 the Commission.
19 I believe that's all of the items -- A Items.
20 What's the pleasure of the Commission?
21 VICE CHAIR CROWLEY: Mr. Chairman, I would
22 move approval of the contracts, revisions and updates
23 to contracts in this list.
24 CHAIRMAN IMBRECHT: Is there a second?
25 COMMISSIONER NOTEWARE: I second it.

1 CHAIRMAN IMBRECHT: Moved by Commissioner
2 Crowlev, seconded by Commissioner Noteware, that the
3 contacts, as enumerated, and the augmentations be
4 improved. Does anyone wish to be heard on any of these
5 items? Is there objection to unanimous roll call?
6 Hearing none, ayes: 4; nos: none. Those contracts have
7 been approved. I believe I should say for the record
8 that I believe Commissioner Gandara will be joining us
9 this morning. Commissioner Commons.

10 COMMISSIONER COMMONS: Point of information
11 before you go into Item No. 1. At the last Business
12 Meeting, you asked that I submit my concurring opinion
13 on Geysers 21. And I have it; I just don't know the
14 proper format in which to submit it.

15 CHAIRMAN IMBRECHT: It seems to me you simply
16 submit it to the Secretariat. It was approved at the
17 last Business Meeting; and so, it's simply a matter of
18 being appropriately published with the remainder of the
19 Order. Do you concur on that Mr. Chamberlain? The
20 question from Commissioner Commons as to the
21 appropriate procedure for his concurring opinion and
22 the Geysers 21 AFC approval of the last meeting. And I
23 suggest that he simply submit to the Secretariat for
24 publication with the remainder of the Order.

25 MR. CHAMBERLAIN: Yes.

1 CHAIRMAN IMBRECHT: Okay. We'll now turn to
2 the remainder of the Business Meeting. The first item
3 to come before us is Commission consideration and
4 possible adoption of amendments to Sections 1602(c),
5 1603(c), 1604(c), and 1606(c) of the Title 20 of the
6 California Administrative Code. These are proposed
7 amendments relating to revise the efficiency standards
8 for heat pumps and three-phase air conditioners.
9 Commissioner Noteware is the Presiding Member; and,
10 I'll call upon you first to give your presentation.

11 COMMISSIONER NOTEWARE: Yes. Thank you Mr.
12 Chairman. This item includes both heat pumps and air
13 conditioners. There are people here who want to speak
14 on both of these issues. And, we also have a staff
15 presentation that I would like to suggest we start the
16 procedure with. I think for the sake of brevity, we
17 would like to have both the air conditioners and the
18 heat pumps considered together or at least the
19 presentation made together. And so, with that let me
20 introduce Bill Pennington and Mike Messenger, who will
21 be making the presentation for staff.

22 MR. PENNINGTON: Alright. Just briefly,
23 Michael Messinger, who is the Senior Program Manager of
24 the Appliance Program, will be making a presentation on
25 the technical findings of the staff analysis.

1 MR. MESSENGER: Good morning Commissioners.
2 It's a pleasure to be here. I'm pleased to report
3 progress towards achieving one of the Commission's
4 primary goals enumerated in the State Energy Plan; and
5 that is, reducing peak requirements.

6 During the past six months, we've been
7 engaged in an analysis to determine whether or not it
8 was appropriate to increase the efficiency standards
9 for heat pumps and, as such, reduce peak load in the
10 number of our State's utilities area. In April, the
11 staff released a report in which it made preliminary
12 recommendations on the appropriate levels at which to
13 set the efficiency. And on May 10th, the Committee
14 issued its recommendation in a Notice of Proposed
15 Action and then, essentially, admendments to the
16 regulations which you have before you today.

17 What I would like to do today is give you a
18 little bit of background information on heat pumps,
19 talk about our findings in terms of cost effectiveness.
20 Item 3 is to talk about how the proposed standards will
21 be technically feasible and attainable. The fourth
22 section we're going to talk about the importance that
23 we feel of adopting these regulations today, and
24 finally staff's recommendation. So, I'll go to the
25 background information first.

1 Heat pumps are basically reversable air
2 conditioners, which have the capability of both heating
3 and cooling. And they are principally installed in hot
4 valley climates. There are two main types of air
5 source heat pumps: split system and single package.
6 And also in this regulation, we are proposing to cover
7 water source heat pumps which use water rather than air
8 as the heat transfer medium.

9 Cooling efficiencies are measured using SEER
10 or Seasonal Energy Efficiency Ratios like the air
11 conditioners. And the heating efficiencies are the
12 efficiency of providing heat to a dwelling, is measured
13 using heating seasonal performance factors. The
14 typical heat pump in California, on a weighted sales
15 basis, uses roughly 3,000 KWh for cooling and 2,400 KWh
16 for heating. This translates to a typical operating
17 cost of around \$432.00, using a statewide average
18 energy cost.

19 Industry data provided during the proceeding
20 showed that there were roughly 45,000 heat pumps
21 shipped to California distribution centers in 1984.
22 The salient point there is that there are a lot less
23 heat pump sold every year than air conditioners.
24 There're about 250 to 300,000 air conditioners sold
25 every year and a lot less heat pumps.

1 Second section here up on the board there is
2 our findings on cost effectiveness. We found that the
3 proposed standards will save consumers between \$203.00
4 and \$472.00 on the life cycle cost basis, depending on
5 which estimate of the incremental cost of providing
6 this increased efficiency to the marked places used.
7 The range of estimates is shown in Table A. And these,
8 again, are the life cycle savings that we found in our
9 analysis; and, they range, as you can see, from \$203.00
10 to \$472.00 -- again, differentiated by the different
11 types of systems and whether or not you use market
12 average cost, which is an average between Carrier's
13 figures and other manufacturers or whether you simply
14 use Carrier's cost data. Staff was unable to
15 determine, and is sort of using as a range, whether or
16 not market average cost or Carrier's cost data were
17 more correct. So we're using both.

18 The next table shows the range of cost data
19 or incremental cost data that was submitted to us. As
20 you can see, there's a considerable amount of disagree-
21 ment between the estimates. Nevertheless, using any of
22 the estimates, the standards are still found to be cost
23 effective. Now, there're lots of sources or reasons
24 why these estimates may be different: has to do with
25 production volume, distributor channels, markup

1 strategies in particular markets, and simply engineer's
2 best professional judgment in terms of what they think
3 they can produce in future years and what the cost is
4 going to be.

5 Table 1 has an.... Excuse me. Let me go
6 back my outline. Staff performed a number of
7 sensitivity analyses on all the major parameters used
8 in its analysis. In all thirty four cases that we
9 analyzed in the staff report, the proposed regulations
10 were cost effective. They were cost effective using a
11 range of credible design life from 12 to 15 years,
12 which a number of people are going to comment on today.
13 There's a range of opinion anywhere from 8 to 15 years
14 in design life that you'll hear today. But we believe
15 the majority of the estimates suggest the design life
16 is somewhere between 12 and 15 years. Nevertheless,
17 it's cost effective using 8 to 10 years if the
18 Commission finds that estimate to be more appropriate.

19 The table up there shows that, in fact, if
20 you go down to 8 years as the design life, we will
21 still be saving the typical consumer money. And I
22 would emphasize that there has been very few
23 manufacturers who would be willing to stand up and say:
24 'Our machine only last for eight years.' Because it's
25 a very substantial investment, on the order of \$3 or

1 \$4,000, to put into a house. And so, people would like
2 their machines to last 15 to 20 years.

3 The standards are also cost effective using a
4 range of discount rates from 4% per year, real, which
5 is what the staff believes is the appropriate discount
6 rate to use, up to 10% per year, real. And again, real
7 means adjusted for inflation. So the real discount
8 rate at 10%, real, is closer to 15% nominal or 16%
9 nominal. But when we use the word "real" that means
10 taking out inflation. It's also cost effective, as I
11 mentioned before, for split systems or single package
12 systems of both 3 ton and 2½ ton capacity, which is the
13 range of capacities that we dealt with in this
14 proceeding.

15 Now, I would like to move to the part of my
16 presentation that deals with technical feasibility and
17 attainability. Basically, the level of compliance in
18 terms of models currently in the market that meet the
19 proposed standards for three years off, is the same as
20 it was for air conditioners. Roughly, 30% of today's
21 models comply with the proposed 1988 standard. From
22 our perspective, that clearly indicates that a
23 substantial number of models can be built that,
24 therefore, the standard is technically feasible.

25

1 The second section is that the proposed
2 regulations are attainable. Our review of our current
3 directory suggest that 12 companies currently
4 manufacture models which meet the proposed 1988
5 standard. These companies represent 75 percent of the
6 market according to the appliance magazines that we've
7 surveyed. We believe that three years' notice is
8 adequate time to retool or replace the remaining lines
9 to meet the proposed standard; and this discussion
10 is...you can go into it at length in the staff report,
11 which I believe you have in your backups.

12 Finally, we think it's very important that
13 the Commission take an affirmative action today to
14 achieve the benefits for both the consumers, the States
15 and the States' utilities. It is more important to
16 maintain efficiency neutrality in the market for
17 cooling systems due to the pressures in the builders'
18 submarket. It would be unfair for us to have a
19 standard of 8.9 SEER for central air conditioners but
20 not for heat pumps, which are, in fact, their primary
21 competitors.

22 We believe it's important to address this
23 potential unfairness in the market by setting the 8.9
24 standard to be effective at the same time, January 1,
25 1988, for both types of cooling equipment. These

1 standards will also reduce the peak demand in many of
2 our State service territories where peak capacity costs
3 are high and growing. Our estimate for SMUD's Service
4 Territory territory, where there are roughly 12,000 to
5 15,000 heat pumps being installed per year, is that
6 this annual peak savings in 1996 will be 60 MW. This
7 would displace the possible need to build the gas
8 turbines as proposed in SMUD's Reource Plan. On a
9 statewide basis, we believe the peak savings will be
10 roughly 200 MW by the year 1996 for heat pumps alone.

11 Finally, I would like to give you a little
12 bit of background information on the options that you
13 have before you. You basically have three options
14 before you for your consideration. The first one is
15 the option that staff proposed which has HSPF levels of
16 6.6 in 1988 and 7.0 in 1993. Those values were
17 obtained using a regression analysis which I will bring
18 you to in a second which found that if the typical
19 model at an 8.9 SEER efficiency level had also a 6.6
20 HSPF level, and similarly, the typical model at 9.9 in
21 the market today has a 7.0 HSPF level, so we felt there
22 was important to keep those continuous and consistent.
23 So those are the levels that we proposed.

24 Carrier Corporation proposed that the HSPF
25 levels proposed by the staff and ratified by the

1 Committee and its Notice of Proposed Action be dropped
2 slightly to 6.8 in 1993 and 6.4 in 1988. The net
3 effect of that is shown on Figure 1. As you can see,
4 the top line is a result of staff's regression analysis
5 which we put through our computers. And, it tells us
6 that that's the best fit in terms of what the
7 relationship between SEER and HSPF is in the market.
8 Below that we put a hypothetical line that would be
9 used if in fact Carrier's recom-medation were adopted.

10 Basically, that will allow manufacturers a
11 lot more latitude in terms of meeting the heating side.
12 Because as you can see, there're very few models that
13 are below Carrier's regression line. However, that's
14 in fact, what Carrier would like to happen. They want
15 people to focus on cooling efficiencies; and, that has
16 a certain ring to it. Because we're mainly interested
17 in reducing peak demand and not necessarily in
18 achieving heating energy savings. So if the signal
19 that we're giving by lowering these HSPF's is for
20 people to primarily concentrate on cooling
21 efficiencies, that's the message that we want to get
22 out.

23 In sum, we would be able to support either of
24 those recommendations: the 7.0 which we originally
25 proposed and find no technical flaws in or Carrier's

1 analysis which is based on their policy preferences to
2 continue design primarily for the cooling side of the
3 market. So the bottom line is the staff supports the
4 Committee's recommendation that it made in it's
5 Committee Report that the June 6th amendment, which is
6 basically an HSPF drop in the 1993 year but not in the
7 1998 year is cost effective for all California
8 consumers and will represent an excellent move for the
9 Commission.

10 And that concludes my presentation.

11 COMMISSIONER NOTEWARE: Thank, you Mr.
12 Messenger. Yes. Ms. Dickey.

13 MS. DICKEY: My name is Dorothy Dickey. And
14 I'm the attorney who's been assigned to this
15 proceeding. I wanted to note briefly that the General
16 Counsel and the Executive Director have determined that
17 the proposed amendments are not subject to the CEQA
18 initial study requirement. They have based that
19 determination upon review by staff of the potential
20 environmental effects to the regulations.

21 Staff reviewed the initial study and negative
22 declaration that was prepared for the air conditioning
23 proceeding and that was adopted by the Commission in
24 December of last year. Staff determined that any
25 potential effects of these proposed amendments would be

1 similar in kind to those assessed in the initial study
2 and negative declaration, but will be reduced in scale
3 because of a significantly fewer number of models of
4 heat pumps and three-phase air conditioners sold.
5 Based upon that analysis, the Executive Director and
6 the General Counsel have determined that it is
7 appropriate not to issue an initial study for these
8 amendments.

9 COMMISSIONER NOTEWARE: Thank you, Ms.
10 Dickey. Now, before we discuss the Committee's
11 recommendation, there are a number of people I would
12 like to call upon who are here to testify this morning.
13 You have the cards over there. And I also would like
14 to reserve the opportunity for Mr. Pennington and Mr.
15 Messenger to respond and also our legal counsel, if
16 that is appropriate. But rather than respond after
17 each testimony's heard maybe you can take notes and
18 summarize the things that you want respond to at the
19 end.

20 MR. MESSENGER: That would be fine. I should
21 note that I had not given the three-phase presentation
22 yet; and, we will hold that until when you....

23 MR. PENNINGTON: I would suggest that we go
24 forward with the Commercial presentation at this point.
25 I think that's consistent with your opening remarks.

1 COMMISSIONER NOTEWARE: Okay. Let's do it
2 that way, then, if you're prepared to go with that one.
3 This is for the three-phase commercial type air
4 conditioner.

5 MR. PENNINGTON: That's correct.

6 MR. MESSENGER: First, let me make sure.
7 Does everyone have copies of the three phase
8 presentation? It's a four-page handout. Okay. I'm
9 going to try to make this presentation even shorter
10 then the last one.

11 Basically, this rulemaking was initiated as a
12 follow-on to the single phase air conditioner
13 rulemaking. And that was.... To refresh your memory,
14 the Commission adopted new standards for single-phase
15 air conditioners in December of 1984. This is an
16 attempt to make it consistent and make that standard
17 apply to all air conditioners as rather than single-
18 phase air conditioners. There is one other type of air
19 conditioners, namely three-phase air conditioners. And
20 they are mainly used in commercial applications.

21 They are used in commercial applications
22 because in commercial application are usually higher
23 voltage. And it's, generally speaking, easier on the
24 wear of the system when you're hooked to up a three-
25 phase motor rather than a single-phase motor. And the

1 single-phase are primarily used in residential
2 application. So what we've done in this analysis is
3 looked at what would the proposed efficiency levels do
4 in a commercial setting where the three-phase air
5 conditioners are primarily installed.

6 We found that the first bullet here is that
7 there's general similarity between the air conditioners
8 and there're major differences just in the circuitry
9 and wiring which allowed the three-phase systems to be
10 used with higher voltages. They're typically installed
11 in low-rise office buildings with each unit cooling at
12 floor air between 1,000 and 2,000 sq. ft. Sales of
13 three-phase equipment in California have been estimated
14 to vary between 20,000 and 30,000 units per year based
15 on information in the forecast.

16 In terms of our cost effectiveness analysis,
17 we analyzed, essentially using the same parameters as
18 for the single-phase analysis, what the cost
19 effectiveness would be. And we have a table here
20 showing our analysis parameters.

21 This table shows that the hours of operation
22 between commercial and residential air conditioners is
23 different. Basically, in commercial buildings the air
24 conditioners run on a full cycle for roughly 8 to 10
25 hours a day; because, there's higher internal loads

1 being generated in the building -- a lot more people,
2 computers, other types of equipment exhausting waste
3 heat. So while we found that the weighted average of
4 hours in the residential sector was only 600 hours, for
5 the commercial sector the weighted average hours was
6 1,500 hours. So as such, this equipment achieve a lot
7 more savings than the residential equipment; because,
8 it's used more. And so, every bit of efficiency that
9 you can get in a system helps you out; because, the
10 usage pattern is roughly 2½ times longer per year.

11 The other change in the analysis parameters
12 was on the value of electricity; and, that is that
13 there is a slightly different commercial electricity
14 rate than for residential. And it's slightly higher in
15 some years and slightly lower in other years. And we
16 just use the commercial rate for the forecast, didn't
17 have any appreciable effect.

18 Given these longer hours of operation and
19 higher electricity prices, the benefits from an air
20 conditioner used in a commercial building will be even
21 greater than the benefits for the same piece of
22 equipment used in a residential building, since the
23 cost in both cases are the same, but the benefits are
24 greater in the commercial case. The increase in SEER
25 for the three-phase air conditioners is cost effective

1 under a variety of estimates. Up on the screen, I put
2 Table 5 which is our sensitivity analysis. Under all
3 the cases that we analyzed, using both DOE costs and
4 estimates from the Trane Corporation, the standards
5 yielded between \$199 and \$270 of life cycle benefit to
6 the average commercial owner or commercial users of
7 this equipment.

8 Turning to the technical feasibility
9 analysis, that was basically very simple; because, the
10 information that we had gathered in the single-phase
11 proceeding also included three-phase equipment. And
12 earlier we had found that the single-phase standards
13 were technically feasible and cost effective at those
14 efficiency levels. Since we're proposing the same
15 levels, the same findings are applicable. We found
16 that there's a substantial number of models in
17 compliance with the 1988 standard and that we believe
18 that the models can be retooled so that they can become
19 in conformance with the 1993 standard.

20 Appendix A is, essentially, a reprint from
21 the staff report on single-phase air conditioners
22 which shows the percentages available at the various
23 efficiency SEER levels.

24 So our bottom line recommendation is that the
25 Commission act to preserve neutrality in the market by

1 adopting standards which parallel the air conditioner
2 standards for single-phase air conditioners and
3 adopting a standard of 8.9 SEER in 1988 and 9.9 SEER in
4 1993. I should say that this recommendation was made
5 in late April; and, it the Committee also endorsed this
6 recommendation in its May 10th Notice to Propose
7 Action. Thank you.

8 COMMISSIONER NOTEWARE: Thank you. Now do we
9 have cards from everyone who wishes to speak on this
10 issue this morning?

11 CHAIRMAN IMBRECHT: If you would please turn
12 those into the Public Adviser's location. Alright.
13 Thank you. Mr. Messenger, Mr. Pennington. First, I
14 would like to call forward Mr. John Oyer, representing
15 the Frederick Air Conditioning Corporation.

16 MR. OYER: I think you have my card. That's
17 John Oyer, O-Y-E-R.

18 CHAIRMAN IMBRECHT: Yes. Would you please
19 come...?

20 MR. OYER: I'm here to speak on a different
21 topic having to do with type of thermal air
22 conditioning and heat pumps. Hold that card until the
23 conversation comes up.

24
25

1 CHAIRMAN IMBRECHT: Oh, I'm sorry. Excuse me.
2 Okay fine. Mr. Michael Gardner, representing Southern
3 California Edison.

4 MR. GARDNER: Thank you, Mr. Chairman. Good
5 morning Commissioners. I will try to be even more
6 brief than Mr. Messenger. I had provided a letter to
7 the Commission with Edison's comments, dated June 18th.
8 And I believe each of you were copied. I'm primarily
9 here to respond to any questions that you may have
10 regarding the letter. In summary, we support the
11 Committee's recommendation for the cooling side
12 efficiency levels. And we think all three of the
13 options identified in the Committee Report on the
14 heating side are reasonable and achievable and do not
15 take a position supporting one versus another of those.

16 I would like to add one additional comment on
17 the American Gas Association letter which was docketed.
18 That letter essentially indicates they do not believe a
19 15 year design life for heat pumps is appropriate. We
20 are aware of only two studies which have looked at a
21 design life or service life of heat pumps. One is the
22 Alabama Electric Study which is the subject of the AGA
23 letter. The other was a survey done by ARI. They both
24 would tend to support a 15 year life which is the
25 assumption used by the Committee. In Edison's view,

1 that appears to be a reasonable assumption for design
2 life.

3 With that, I would be happy to respond to any
4 questions. I do have a technical person with me, if
5 that would be of assistance.

6 CHAIRMAN IMBRECHT: Questions? You do
7 reiterate your position, I notice on the letter,
8 relative to re-examination of the standards that are
9 triggered to go into effect in '93, as well.

10 MR. GARDNER: Yes, sir. Yes. And, by the
11 way....

12 CHAIRMAN IMBRECHT: I mention that only since
13 that's obviously consistent with my own position on
14 this matter.

15 MR. GARDNER: My letter was silent as to the
16 standards for the three-phase air conditioners. And I
17 should add that we also support the Committee
18 recommendation there.

19 CHAIRMAN IMBRECHT: Thank you very much.

20 MR. GARDNER: Thank you.

21 CHAIRMAN IMBRECHT: Former Commissioner
22 Emilio Varanini, representing the Trane Company. It's
23 always nice to have you with us, Gene.

24 MR. VARANINI: Fine. Commissioners, I 've
25 been retained over the last several months as a

1 consultant to the Trane Corporation, Division of
2 American Standard, Incorporated, to really look at the
3 policy and the process implications of your proceedings
4 on both air conditioners and heat pumps.

5 I think that what you should understand is
6 that what you're doing here may be much more important
7 than you initially sort of realize in terms of a sort
8 of larger picture. I'm currently serving as an Advisor
9 to one of the shadow energy future project that's being
10 prepared for the next administration's advent in
11 Washington and is supported by this administration.
12 And California really has become a prototypical
13 environment in which many of the ideas that these types
14 of institutions are looking at are evaluating. And
15 they're looking very, very carefully at what you're
16 doing.

17 You are in the forefront of a whole plethora
18 of developments ranging from forecasting all the way
19 down to your synthetic fuels program. And you're also
20 are in a situation where you run one of the few
21 integrated programs in the United States. The National
22 program or the State programs are bulkitized. And your
23 programs really run from both an integral legislative
24 base and are managed from a unified perspective. So in
25 that sense, I think you need to slow down a little bit

1 and think through some of the implications of what
2 you're doing. I realize that you're on timeframes and
3 on time stresses that are very difficult. But I'd like
4 to point out a couple of things to your attention
5 today.

6 Now, one of the things I learned from
7 Chairman Imbrecht, among other things, was how to
8 count. I know how to count; and, I think that for
9 purposes of today, I want to make a couple of sort of
10 deeper type of comments, rather than simply engage in
11 some of the exchanges that I have in the past.

12 First of all, you have a real fundamental
13 double counting problem whether you know it or not
14 inside these models and the implications of them. And
15 I think you know that, really, inherently. You're
16 running so many different programs that impinge on
17 energy consumption, electricity consumption, that it's
18 just intuitive that there has to be some overlaps and
19 gaps in those things. And I think one of the things
20 that have been pointed by your friends in the building
21 industry is that there really is a confluence of the
22 standards that you're moving on today in your building
23 standards. Now, we went through and we built an actual
24 record from your record.

25

1 We extrapolated the entire record just to see
2 what you're thinking about. And in doing that almost
3 all of the Commissioners at one point or another have
4 basically indicated that they believe there is double
5 counting, that there is a problem between a performance
6 standard system in residential construction and the use
7 of prescriptive standards over here on certain
8 appliances that impinge on the residential construc-
9 tion, particularly here space conditioning. You've all
10 admitted that. If you go through the record,
11 Commissioner Commons has raised that question a
12 substantial number of times. The Chairman has raised
13 the issue. Former Commissioners have raised it, as
14 well. And we are trying to look at that problem really
15 in the u-ris-tic (PHONETICALLY DERIVED) sense.

16 We don't know what the number are. But we
17 think that it's pretty important to try to find that
18 out, certainly in the longer run. Remember, you're
19 setting standards, the stream of income of which or
20 revenues of which or benefits of which are being
21 measured in your 2007. That's a very, very long period
22 of time. That's a very, very uncertain kind of
23 calculation, to say the least. But we know right up
24 front that you've got impingement problem. And I think
25 you have some obligation, because of the nationwide

1 impact of these standards, to really at some point get
2 that under control analytically.

3 You're using an algebraic modeling format in
4 once sense, with your static model for this type of
5 calculations, and then you built, probably, the
6 premiere dynamic model in the United States and maybe
7 even in the world, for purposes of the general
8 environment. That dynamic model is discounting the
9 values you're calculating today. You calculate them
10 today and fly them here. And your other modeling
11 efforts discount them as best we can tell from outside.
12 It doesn't matter; all the models are black boxes, if
13 one's going to attack modeling as some form of intellec-
14 tual assault. So, we think that that's one big and
15 serious problem.

16 Your staff has said that it can't calculate
17 these things. It thinks that it's a very difficult
18 thing to do. They said that on the record. They're
19 not sure that the problem exist. And to the extent it
20 does, they can't calculate it. Well, I think if it's
21 something that they can't, it's something that they
22 certainly need to work on and try to advance that.

23 In addition, if you are impinging on those
24 standards. And your staff on the record said you were.
25 They believe that this decision, actually affects the

1 residential building standards. That's a direct quote
2 out of the record. If that's true, then you're doing
3 defacto what you say you're not doing dejure. I think
4 you've got to straighten that out; because, it going to
5 be a very, very complicated situation as we go on into
6 judicial review and other kinds of reviews of these
7 processes. And I think you want to make sure that you
8 got a good handle on it.

9 A second major problem that we see is that
10 these standards lock in what's going to happen anyway.
11 There's a lot of talk that you need these standards
12 because they need to basically be able to factor
13 properly for discounting power plants and discounting
14 other types of supply side options. Well, the fact of
15 the matter is you don't have any empirical data on
16 that. You don't know; and, I don't know that. I can
17 tell you that the two instances of empericism on your
18 record: the PGandE data and that data coming from
19 another source (that I can't recall right now) tend to
20 indicate that you don't quite...reality doesn't match
21 up to the modeling effort in terms of static modeling.
22 And it may be off significantly because of exogenous
23 variables, people aren't home, go on vacation, they
24 don't run the thing night and day, and so forth and so
25

1 on. I think that's something to, at least, take into
2 account--the factor.

3 If you're going to say you're setting
4 standards that are taking place and you're merely
5 locking them in so you can count them as against power
6 plant displacement, then be sure that you have some
7 feedback mechanism so that you don't get in the
8 situation we were in the early '70s and mid '70s when
9 we didn't know where we were and a lot of the large
10 scale decision-making was done by dart boards and other
11 auguries. So I think that's something to think about.

12 The third thing is: Who these standards are
13 cost effective for? Let's eliminate some of the
14 nonsense considering the mythical average person.
15 We're really looking at some kind of entity that
16 represents a majority. You could have an average
17 person who's different than the majority of people,
18 simply because of the way the climate zones and other
19 systems break down in the State. You need to do a
20 little bit of gamesmanship with your data to sensitize
21 it to that and just see what's going on -- Where is the
22 mode? Where does it fall? Is this thing a bell shape
23 curve? Is it skewed left or right? You need to take
24 into account at some point and time. Because you're
25 making very large scale impacts. And you're doing

1 straightforward static analysis. I think that's
2 important to take into account.

3 Finally, we've identified (and I'll leave
4 this for the record) a whole series of details that
5 need to be eventually straightened out. You need to
6 disaggregate your models. You have to do something
7 about old retrofit versus new construction. It's one
8 thing to model or attempt to model new homes as a
9 problem in a retrofit market, overlapping conservation
10 programs, consumer behavior. The artificiality of this
11 problem of design life, you need to take a hard look at
12 that. You're getting totally conflicting data from
13 inside the industry and from outside the industry, for
14 that matter. And that's your call. It's really your
15 call.

16 You need to think about price elasticity.
17 This Commission led the United States in terms of
18 figuring out the obvious -- that price elasticities in
19 demand when prices went up would reduce electricity
20 consumption. Now, you might think that if can reduce
21 the consumer's cost of electricity, they might use some
22 increment more in terms of cooling. One wouldn't
23 simply assume that the consumer necessarily would be
24 neutral to all of this. And I think that's important
25 and then, finally, this uncertainty factor in the year

1 2007. That's a tough call, brave human being. It may
2 be what you're paid to do; but, you better be very
3 careful in those kinds of long range calls.

4 The final thing is, your staff -- and I think
5 rightly so -- is watching peak very, very carefully.
6 And the law is really designed at a different standard.
7 The law is designed to deal with pricing--an average
8 pricing to the consumer. And in watching that peak and
9 the dichotomy could lead to some interesting results.
10 You could set a SEER, it seems to me, that would end up
11 increasing peak.

12 You'd increase the SEER and increase peak
13 draw and not just the behavioral solutions either. You
14 can get an industry that begins to figure out what's
15 literally the cheapest way to get around your standard.
16 And that might, in fact, lead to certain types of
17 equipment that draw heavier on peak. When people are
18 very, very warm, they turn on a machine that does
19 double duty or has some extra kind of add-on that keeps
20 its average system low, but pops up on peak. I think
21 that's something that you need to think about.

22 My reaction is that you're under a terrific
23 time constraint here, given laws and things that we
24 worked on last year. Your staff is basically under
25 terrific pressure in terms of having to churn out--two

1 people, basically turning out tonnage levels of
2 analysis. And I think that in that sense, we've try to
3 call to your attention to a whole series of parameters
4 here that I think create problems, called some of the
5 results into doubt and tend to take the technical
6 aspects of this argument from this forum and move in
7 into forums where there are, perhaps, more attained.
8 And I think that's one of the problems when you're not
9 sensitive to very large concerns coming from a bulk of
10 your regulatees, as well as some elements of public.

11 And I would be happy to answer any questions.
12 And I'll leave this with the Secretariat; and you can
13 peruse it. I did give it to the Adviser; so, I think
14 that there's been some time that they've had to resolve
15 it. I also was very much appreciative of Commissioner
16 Noteware's Final Report in the sense of the recognition
17 of the uncertainties and the data problems that are
18 created because of the substantial differences within
19 the industry and their views of this matter. I think
20 that was a very frank and very forthright statement of
21 the level of uncertainty that you're operating under.
22 And I appreciated that.

23 CHAIRMAN IMBRECHT: Thank you. To say the
24 lease, your comments are always challenging from a
25 linguistic and vocabulary standpoint. I pride myself

1 of my own vocabulary. But you always manage to stomp
2 me with a couple of words.

3 MR. VARANINI: If I don't, I'll invent a
4 couple for you.

5 CHAIRMAN IMBRECHT: That's what I was
6 wondering, frankly.

7 COMMISSIONER COMMONS: What is peak?

8 CHAIRMAN IMBRECHT: Actually, I was curious
9 about uristic. In any case. Commissioner Commons.

10 COMMISSIONER COMMONS: Just one comment,
11 Gene. When you try to look at this on a national
12 level, I think there are two other critical factors
13 that you have to look at. One is that all of the
14 economic assessment in California excludes peak. And
15 if you're looking at what the nation ought to be doing
16 or any particular state ought to be doing, clearly
17 we've shown this proceeding that when we look at the
18 capacity needs which is probably half the benefit that
19 comes from peak. And so, I think it would be very
20 cautious or prudent of yourself to take that into
21 consideration.

22 In the same sense, also that when you look
23 nationally, most states don't have a building standards
24 and that integration problem that you identify. And
25 you may have a chicken and the egg problem in appliance

1 standard on it's cost effectiveness as to whether or
2 not it should be reviewed in light of a building
3 standard or not. When you go national that problem
4 becomes very different than the perspective, I think,
5 in which you put it.

6 MR. VARANINI: I think that's true.

7 CHAIRMAN IMBRECHT: Any further questions?
8 Commissioner Noteware.

9 COMMISSIONER NOTEWARE: Yes. Gene, you've
10 given us a lot food for thought here. And I'm
11 wondering if you have any very specific recommendations
12 regarding this particular issue this morning that you
13 would like to zero in on and be a little bit more
14 specific about what you would like to see us do.

15 MR. VARANINI: Well, I would just say, I'm
16 not really authorized to represent Trane in the sense
17 of either concessions or negotiations. But from a
18 third party perspective, from my own basis of analysis
19 of the process part of the record, I would be very,
20 very disturbed trying to set a standard in 1993 that
21 has a flow-through effect through the year 2007. I
22 don't think you have the data. I don't think you have
23 the sensitivity analysis. I think that your static
24 models are fine as far as they go. But, I would not

25

1 want to make a call over that very, very long period of
2 time.

3 Now, the Commission identified that on a
4 split vote the last time. And I think that one should
5 think through whether the principle is more important
6 than symmetry. Or the principle of being able to call
7 something in 1993 and the uncertainty through the year
8 2007 is more important than maintaining some form of
9 symmetrical regulation.

10 And the reason for that is, is because as you
11 all know, the standard is different if you want to go
12 back and fix it. Commission Commons, in what I think
13 was a brilliant maneuver at the time, was able to
14 negotiate into the statute that passed last year, the
15 affect that, if you put a standard in, you use one type
16 of an economic analysis; if you take a standard out, it
17 appears to some, in the reading of that statute, you
18 use a different kind of analysis. And the analysis
19 begins to shift from a consumer base to a ratepayer
20 base. And I think that makes it much more difficult.

21 I think your comment in your report would be
22 appropriate if there was not this difference in
23 standards in how you're going to have to treat people
24 coming and going. You also know that if you go and
25 back off of a standard, then you have to go back and

1 redo your forecast--your longer range forecast. And
2 I'm sure you'll end up with that type of issue moving
3 on to supervision by the judicial branch as well.
4 There are too many players in this. And the standards
5 of an offer is approved and the types of judgments you
6 are supposed to make are just queazy enough that it
7 seems to me it is not a simple matter to lateral this
8 to Commissions coming after you and say, "Well gee, if
9 we were wrong in year 2007, maybe in the year '91 they
10 could fix it.' I would be very careful about that. I
11 think that's the critical issue from my perspective.
12 The appliance certainly have a much more analytical and
13 engineering base set of concerns. But those would be
14 mine.

15 COMMISSIONER NOTEWARE: Thank you.

16 CHAIRMAN IMBRECHT: Quite candidly, that's
17 generally reflective of my own views I've expressed on
18 a number of occasions. I think with the volatility
19 that we've all observed with respect to energy
20 supplies, relative availability of variety of fuel
21 sources, etc. and forecasts, that at one point or
22 another predicted dire consequences and, in fact,
23 obvioulsy have not at least near-term proven to be
24 true, I remain more of a viewpoint that it would be
25 more rational to revisit this entire subject out

1 towards the end of this decade in anticipation of still
2 providing the industry an adequate amount of leadtime
3 to reconcile new standards that will trigger in '92 or
4 '93.

5 At the same time, and of course it's also
6 difficult to understand whether, in fact, we are a
7 driving force that has produced some these results, but
8 I have to at least in a sense take constructive notice
9 of what's happening with respect to the ASHRAE
10 promogated guidelines or standards as well, which seem
11 to have a fair amount of symmetry as well with that
12 which has been adopted here at the Commission.

13 MR. VARANINI: I think the other thing, Mr.
14 Chairman, is that one of the interesting things, if you
15 look at how you affect other interests or the number of
16 foreign interests that are on your mailing list, this
17 is not a small potatoes kind of situation. It looks to
18 me like it would be very interesting to take the
19 entities that are on your service lists and on your
20 mailing lists and see which of those are currently in
21 this business and which of those may be doing strategic
22 planning to enter or intersect this business somewhere
23 out of the time frame that you're guessing at, and who
24 don't have some cost in set technology, and who don't
25 have some cost in re-cooling, and whether or not there

1 really are some very important implications to what
2 you're doing in terms of one of those more substantial
3 markets in the world. We're still maintaining about a
4 6th or 7th level economy in the ranking of the
5 economies in the world. And, I'd be very careful.
6 And, I think it's particularly important that these
7 interests are watching what you're doing extremely
8 carefully.

9 CHAIRMAN IMBRECHT: Commissioner Commons.

10 COMMISSIONER COMMONS: Since we're discussing
11 this one item, I'll make a comment or two on it. If we
12 don't have the second step, if we build power plants,
13 the main reason costs of energy go up in the State of
14 California is the building of power plants. And,
15 unless we change the method by which we site and
16 estimate demand in this State, the second step would
17 essentially result in some 1,000/2,000 MW of additional
18 power plants. And, in the northern part of the State
19 that would, particularly have economic significance
20 where we have no need for energy and we primarily have
21 a need for capacity. And, we'd be passing on a major
22 cost through the ratepayers.

23 Second is, by giving industry advanced notice
24 we're really following what ASHRAE has done with the
25 two steps. We're going to result in more competition

1 in the market and a lower cost of the product; because,
2 the design engineering of these products requires more
3 than two or three years to make any significant
4 improvements. And so, by putting out a notice seven or
5 eight years, by the time you go from design or the
6 initial engineering of the product to the market
7 testing, approval, licensing, distribution, manufac-
8 turing changes, you require that time. And, that's
9 been clear from the industry if they're talking about
10 anything other than a minor change, that they do this.

11 The alternative of going and saying this is
12 cost-effective and putting it all in affect in 1988
13 would have such a dramatic affect on particularly the
14 smaller and medium size manufacturers. Essentially,
15 what we've done is, we're saying: 'This is what we'd
16 like to see you do. But, we're going to give you an
17 extra period of time and, then a return on the
18 investment of those people.' (Which has been requested
19 by industry as five years to get that initial
20 investment out.) And so, essentially, what we're doing
21 is not having a two-step standard. We're having a one-
22 step standard, but giving leeway to the industry to
23 make that capital investment so we can keep the cost of
24 the product down and allow the companies to do their
25 engineering in a judicious way.

1 And then, the last point is that you talk
2 about 2005, we're going and siting power plants which
3 will be built in the late 1980s, early 1990s. And,
4 they'll be around in 2020 and 2030. And, that's where
5 the big decisions, in terms of capital investments of
6 this Commission, are concerned. And, we've got to
7 integrate in terms of.... We're looking at conserva-
8 tion as a supply resource. Certainly, there's
9 uncertainties. But, we're still going to go and site
10 those power plants. And, if we make an incorrect
11 decision here or there, at least it's going to be an
12 integrated decision. And, what this Commission has
13 very hard argued is, we're looking for a balanced
14 portfolio. We're not going to put all our investment
15 into one area. We're not going to put it all in
16 conservation. We're not going to put it all into oil
17 and gas facilities. And so, we've balance that, I
18 think, by taking the approach that the Commission
19 adopted under BR V.

20 MR. VARANINI: I think that many of those are
21 laudatory goals. I think that if you put the same
22 effort into this particular type of decision that you
23 put into power plants then, I think that you certainly
24 could sit there and say that you can trade off the
25 values because you have a certain level of confidence.

1 It seems to me, if you use a simple static model and
2 you're trying to make guesses about the future,
3 spending literally thousands of dollars on that and
4 millions on your model for making these other
5 decisions, that you really have a system that has
6 produced and put its values where it feels its
7 regulatory muscle and implications are. But, you
8 haven't balanced them out analytically.

9 Secondly, in terms of the long-term future,
10 we, collectively, haven't sited anything. What's
11 actually happened is that the uncertainty analysis on
12 these very large (INAUDIBLE) have actually crippled the
13 process. And, I think this Commission has adopted a
14 wholly different philosophy, that you want to go with
15 smaller, shorter lead time, less intrusive plants.
16 And, you've done that simply to get around that problem
17 of guessing and betting the company on just massive
18 projects.

19 So, it seems to me that if you put an equal
20 level over of analytical effort and if you are
21 confident you know what you're doing or, at least,
22 anyone in your situation would know you had the most
23 reasonable amount of data that you could process in
24 front of you then, I think, it's perfectly appropriate
25 to use that as your balance lever on decision-making.

1 CHAIRMAN IMBRECHT: Okay. Thank you very
2 much. I don't believe there are any other further
3 questions. Appreciate your presentation. Next, Mr.
4 S.L. Craig, representing Borg-Warner.

5 MR. CRAIG: Good morning, Commissioners.
6 Rather than read my statement word-for-word, I will try
7 and paraphrase it to, perhaps, save some time.

8 COMMISSIONER NOTEWARE: We'll appreciate
9 that.

10 MR. CRAIG: First of all, we have some
11 observations about the staff report and so forth. And,
12 I don't think we need to get into an argument about it.
13 It's not infallible; andm there are some errors and
14 some misleading statements. And I'll just mention one
15 or two here for your guidance.

16 The real issue, of course, today is what we
17 propose to come up with as a standard for heat pumps
18 and three-phase equipment. We have made a couple of
19 recommendations. First, in general, we think that
20 there should be only one level (that's the one for
21 1988) and then, of course, to make a goal or so forth
22 for 1993. I just heard the address by Commissioner
23 Commons; and, I understand his feelings on the matter.
24 We have the opposite view. We feel that we're laying
25 on the next generation something that they should

1 decide and not ourselves. That's one of our
2 recommendations.

3 The other has to do with three-phase
4 equipment. The proposed standard is using a
5 residential descriptor rather than a commercial
6 descriptor by siting SEER rather than EER. We've
7 spoken to that before. We feel that it should follow
8 the pattern of the industry and use the EER and COP for
9 three-phase, and SEER and HSPF for single-phase. And,
10 we think this is important if you ever intend to use
11 the ARI Directory as a vehicle for enforcement.
12 Because, this is the way we are now published in our
13 certified ratings.

14 One thing which is not in my report and which
15 I'll mention just now, since we're talking about
16 commercial, when we talk about power plant siting and
17 so forth, I just read read recently where some of the
18 buildings are coming in over their estimated usage
19 because of personal computers. It seems that every
20 employee now has to have one. And, in some cases it's
21 using twice as much energy as had been anticipated.
22 So, maybe you better take a look at what's going on in
23 this phase of the industry.

24 The next item which I would address is heat
25 pumps. And, it's always been customary in the past and

1 in most of the standards that there's a differential
2 between heat pumps and air conditioners. And, there's
3 a good reason for that. And I've made a very simple
4 diagram and have attached it to my notes. And you can
5 see the difference because of the added components that
6 go into a heat pump system.

7 We have reversing valves, accumulators and
8 additional refrigeration circuits within the system,
9 plus an additional refrigeration charge. When you take
10 all these things and exposed surface to the atmosphere,
11 pressure losses within the system, obviously, you
12 cannot get the same efficiency out of a heat pump as
13 you can an air conditioner when you use the air
14 conditioner as a reverse cycle unit. And, this is
15 typically what is done in order to have economies of
16 scale in the manufacturing process.

17 A couple of losses which are not too
18 noticeable from the diagram is in the design of a
19 condenser itself. As the velocity.... We try to keep
20 the velocity of refrigerant gas up as high as we can in
21 order to get the maximum heat transfer. So, with an
22 air conditioner and the outdoor coil, we usually limit
23 it to one or two circuits. And that keeps the velocity
24 high so that we get the high efficiency.

25

1 Well, as you know, in the heat pump the
2 outdoor coil now becomes the evaporator. And we have
3 liquid in there instead of gas; and we got to put in
4 additional circuits to take care of the flow of the
5 liquid rather than the gas. But, when we reverse it
6 again, back to an air conditioner cycle, we got these
7 additional circuits and, of course, we lose the
8 efficiency. And, also, in refrigered charge, I
9 mentioned that more charge does accumulate in the
10 accumulator in the off cycle. And when it starts up it
11 takes it many minutes before the flow rate arrives at
12 its peak performance. So, all of these things add to a
13 loss in efficiency. And, it's our recommendation that
14 it be at least a differential of half a SEER between
15 air conditioners and heat pumps.

16 I guess our real big concern is the product
17 availability. Mike Messenger did show you the diagram
18 that he had made up using the current Figure 1 from the
19 staff report showing where the good and the bad fell.
20 And, I have done the same thing for split systems.
21 And, it's not too difficult to see that about 75% of
22 the products will be eliminated on January 1, 1988,
23 another 15% on '93. Of course, we're going on the
24 supposition that, yes, the manufacturers will redesign
25 before that 1993 date, in plenty of time, etc., etc.

1 But, actually, when you look at the market for heat
2 pumps in California, it's somewhat less than 40,000
3 units a year for split systems. I'd say there's no
4 incentive there for a manufacturer to try to turn his
5 operation around and design a product line consisting
6 of seven models, or at least six models to meet such a
7 small demand.

8 The package units is even worse. If you look
9 at the Figure 2 on the sketch, you can see that there's
10 only two models that really qualify in 1993. And,
11 there, we're talking now about less than 20,000 units
12 to a manufacturer. And, there is really no incentive
13 to try to redesign the product. So again, we're
14 recommending that we maintain at about a 5%
15 differential between heat pump...5%... .5 SEER between
16 heat pumps and air conditioners.

17 My final comment has to do with HSPF. I
18 think the diagrams that have been shown show that there
19 is no correlation between HSPF and SEER. There's been
20 no other testimony given to that affect. So, we really
21 can't draw a straight line and say, 'Hey, this is what
22 it's going to be.' Our only comment, at this point, is
23 that we really don't know. We think we should give
24 this as much latitude as possible to the manufacturers
25 for the design of the equipment. And, we would simply

1 recommend the lower HSPF which have been offered as
2 alternates to the standard.

3 That's my comments and I appreciate the
4 opportunity to speak before the Commission. I'll
5 answer any questions.

6 VICE CHAIR CROWLEY: Commissioner Commons.

7 COMMISSIONER COMMONS: In the states that are
8 really hot and stays hot at night -- Arizona, Texas,
9 some of the sunbelt States -- don't they buy much more
10 efficient equipment than in California? Because, the
11 cost effectiveness, obviously, would be greater when
12 those hours start going up to 1,500 hours.

13 MR. CRAIG: I'll tell you, Commissioner. In
14 Arizona, for instance, in Phoenix, Arizona, and in
15 Texas, particularly, they have a number of incentive
16 programs operated by the utilities which do tend to
17 force higher efficiency equipment into those markets.
18 And, yes, I would say that higher efficiency is sold
19 there; but, it's for a different, maybe from not a cost-
20 effective but from just the incentive part of it. And,
21 we do provide high efficiency equipment; and it's worth
22 it. Yes.

23 COMMISSIONER COMMONS: That would tend to
24 increase the.... California is not at the extreme in
25 terms of the need for air conditioners like a lot of

1 the states. And, I would think a lot of the other
2 states would, just in the market, be demanding air
3 conditioners more efficient than people would in
4 California. I can't understand why there'd be a
5 product availability problem when these other states
6 are so much hotter and more humid, and, particularly
7 the nighttime temperatures don't drop.

8 MR. CRAIG: Well, at the present time, the
9 9.9, I don't think there's.... I'll have to go from
10 memory. I've forgotten what the actual top level is
11 right now for incentives in both of those areas of
12 Dallas and Phoenix, for instance, and some in Florida.
13 To my knowledge, they have not reached the 9.9 level.
14 But, I'm just guessing at that. And, of course, in
15 packaged units, they're not too common in those
16 markets. Well.... Phoenix is packaged; but, the
17 others are not a common product.

18 VICE CHAIR CROWLEY: Thank you. Did you have
19 some comment?

20 COMMISSIONER NOTEWARE: I just wanted to
21 assure Mr. Craig that he should be careful about saying
22 things about those personal computers; or, people will
23 be telling us that we should set minimum efficiency
24 standards on PC's next.

25 MR. CRAIG: That may be your next approach.

1 VICE CHAIR CROWLEY: Thank you, Mr. Craig.
2 We have Mr. Joe McGuire of ARI who wishes to comment.

3 MR. MCGUIRE: Good morning Commissioners.
4 First of all, what I'd like to do is submit for the
5 record some explanatory material regarding an exhibit
6 that I submitted during the hearing of May 24th. And,
7 this is at the request of Mr. Wheatland of the
8 Commission's legal staff. So, I'll leave this document
9 here with the letter for inclusion in the record, if I
10 may.

11 VICE CHAIR CROWLEY: If you would.

12 MR. MCGUIRE: I would also like to clarify
13 one point before I begin my testimony. And, that has
14 to do with the staff's document, dated June 19th, in
15 which they respond to several of the comments raised at
16 the hearing in May.

17 On page 6 of that document, staff indicates
18 that data submitted as part of this rulemaking that had
19 to do with heat pump shipments to the different cities
20 and counties in California was originated from ARI.
21 And, I've pointed out in May that that is not the case.
22 The information was submitted by Mr. Baily of Carrier.
23 And, he may have made some interpretations of data from
24 ARI originally. But, the data that is part of the
25 record is not ARI information. And, our statistics

1 program does not furnish information at the county
2 level or the city level. It is by certain trading area
3 reports and does not break out by capacity or
4 efficiency. Thank you.

5 My comments today, I'm certain, will not be a
6 surprise to any of the Commissioners. But, I will
7 reiterate some of the points we have made throughout
8 this rulemaking proceeding for the record.

9 On behalf of a majority of our members -- the
10 manufacturers of central air conditioning heat pumps
11 and three-phase air conditioners -- ARI is opposed to
12 the proposed revisions of the minimum efficiency
13 standards which are 8.9 SEER for 1988 and 9.9 for 1983.
14 We have suggested and continue to recommend that the
15 revisions to the Standards be no higher than 8.5 SEER
16 for 1988, and, that the Commission not enact a second
17 tier of the Standards at this time. This proposed
18 revision, we feel, will provide a cost effective
19 revision to the Standards in California. And, it will
20 also not adversely impact small manufacturers of heat
21 pumps and central air conditioners as would with staff
22 proposal.

23 In the staff's analysis of the impact of the
24 proposed Standards on small businesses, we feel they
25 fail to focus on the impact on small manufacturers, but

1 focus solely on the impact on contractors or those who
2 sell the equipment. The heat pump and air conditioning
3 manufacturing industry is made up of many small and
4 medium size companies that compete with some of the
5 larger companies. And, if I could turn your attention
6 to the chart being put up on the screen. This will
7 show the impact on ten small to medium size companies
8 that participate in the ARI Unitary Certification
9 Program for Heat Pumps and Central Air Conditioners.

10 The bar charts there point out the impact of
11 a 8.9 SEER standard on these companies and their
12 product availability in a single package, cooling-only
13 mode, a split system, cooling-only mode and the third
14 for heat pumps. And, the heat pump category is for
15 both types of heat pumps. Heat pumps also are in
16 single package and split system. As you can see by
17 that chart, none of the companies there really have a
18 significant amount of models at this time that meet the
19 8.9 SEER standard.

20 What this means is that virtually all the
21 smaller and medium size companies are going to have to
22 do almost a complete redesign of their product lines to
23 meet these standards. And, while some of the larger
24 companies will also have to go through some serious
25

1 redesign, they will not have to do their entire product
2 line.

3 And, the staff also addressed the issue of
4 how these standards impact small companies in their
5 June 19th document. But, they did not.... They simply
6 looked at the model availability for the industry as a
7 whole, and, really did not focus on what can happen to
8 the smaller and medium size companies. And, we think
9 it's very important that these standards really will
10 have a significant impact on these types of companies.

11 Just as a comparison for a different level of
12 standard, what ARI is proposing is that the efficiency
13 be no higher than 8.5. As you can see in this chart,
14 these same companies are in a much more realistic
15 position to meet that standard. And, would certainly
16 have to do some redesign of their product lines, but,
17 would not have to go through as drastic a step. So, we
18 would urge the Commissioners to weigh heavily the
19 impacts of these provisions and proposals on the small
20 and medium size companies.

21 We also believe that the imposition of a
22 second tier standard for 1993 is unnecessary and serves
23 no useful purpose to either the consumers of the State
24 of California or the manufacturers. It is premature
25 for the Commission or the staff, at this point, to

1 attempt to predict the needs of California for 1993
2 with respect to the efficiencies of central air
3 conditioners and heat pumps.

4 As far as a reference point for manufacturers
5 to target, the 1993 level serves no useful purpose
6 either. Planning periods for new products do not
7 extend to 1993. Also, as you certainly are aware, many
8 circumstances can change before 1993 to render that
9 number irrelevant. We had hoped, through our
10 presentation of shipment information in many of the
11 Proceedings in the last two years before the
12 Commission, that we have demonstrated to the Commission
13 that a positive trend in increasing efficiency as a
14 product is occurring on a national basis.

15 California Energy Commission believes that
16 this trend is not enough to ensure energy conservation
17 in a state with respect to our product. While the
18 industry may disagree with that, we understand that the
19 Commission is intent on regulating these products.
20 But, at the same time, we would employ you to be
21 reasonable in focusing in a role of minimum efficiency
22 standards. We have attempted to point out that minimum
23 efficiency standards should not remove cost effective
24 products from the market. The State of California has
25

1 an immense variety of climatic conditions, essentially
2 embodying all the types found in the United States.

3 How can a minimum standard be cost effective
4 for the people of Los Angeles and San Francisco? It
5 cannot, unless it is set at a level that does not
6 preclude the purchase of lower efficiency units that
7 are not run as much as units in more severe conditions.
8 While the shipment weighted average of heat pumps on a
9 national basis last year was 8.4 SEER, this does not
10 mean that purchases of units below that level are not
11 cost effective. The Warren-Alquist Act balances the
12 goals of a sound energy policy with economic realities.

13 I would suggest that the Commission analyze
14 the Act from that perspective and request that the
15 Commission vote against the second level of standards
16 as an unnecessary step. And, perhaps, if you feel that
17 focusing on 1993 is important, perhaps, that level
18 could be viewed as a goal or a target, rather than a
19 mandatory standard.

20 With respect to the heating descriptors and
21 HSPF, the staff has indicated that it believes HSPF is
22 the proper heating descriptor for the single and three-
23 phase products below 65,000. They had asked us (ARI)
24 to consider modifying our directory to include this
25 information. I pointed out in May that at the present

1 time our certification program uses COP as the heating
2 descriptor three-phase equipment. And, a majority of
3 the participants in that program continue to favor
4 that. And, this will be brought up time and again by
5 our section in the near future. But, at this point,
6 the majority of the companies feel that COP is the
7 proper descriptor on the heating side for three-phase
8 equipment.

9 Regarding HSPF levels, the Commission favors
10 the original HSPF levels as proposed by the staff. We
11 would suggest that they should be prepared to obtain
12 relevant cost information for increasing the HSPF to
13 these levels, as this information was now requested in
14 the workshop proceedings.

15 Regarding water source heat pumps, ARI would
16 recommend for 1988, an EER of 9.0 where the heating
17 efficiency COP of 3.0. ARI would, again, urge the
18 Commission not to set a second tier standard for these
19 products at this time. Our members, however, in
20 response to ASHRAE indicated that 1992 levels should be
21 not higher than 9.5 EER and 3.2 COP.

22 For three-phase air conditioners, I would
23 point out, that we believe staff has made some broad
24 generalizations about this type of equipment as to its
25 cost and the application of the products. And, it was

1 sort of tagged on at the end of the rulemaking. And, I
2 believe, not given the proper amount of attention that
3 it deserved, ARI has no concensus as to whether SEER or
4 EER is a proper descriptor on the three-phase
5 equipment. We would, however, recommend that if SEER
6 is chosen as the descriptor for three-phase equipment,
7 it be no higher than the same level as that for single-
8 phase which our recommendation was 8.5.

9 Rather than going through the other kind of
10 general comments I had, which I also brought up at the
11 May hearing, I would ask the Commissioners to review,
12 if they could, material I submitted in May which was
13 prepared for the ARI in conjunction with the Biennial
14 and Electricity Reports which we feel brings up several
15 policy-type questions which Mr. Varanini, I think,
16 touched on some of them today, as to how the
17 legislation and how the role of the Commission filters
18 down to the actual development of applying standards.

19 I would end my remarks there and would ask
20 the Commissioners to try to view this rulemaking as to
21 its impact on all of the parties involved, and, hope
22 that you would analyze all of the information that has
23 been submitted at this point into the record. Thank
24 you.

25 CHAIRMAN IMBRECHT: Commissioner Commons.

1 COMMISSIONER COMMONS: Joe, if the single-
2 phase standard were 8.9, would you want to see that the
3 three-phase standard would be consistent, in any event,
4 with what the single-phase standard is on commercial?

5 MR. MCGUIRE: The.... To be honest with you
6 our manufacturers really do not have the time to focus
7 on that question as it pertains to this through the ARI
8 forum. It came up late in the rulemaking. And, I
9 would really have to defer to our individual companies
10 at that point. I would just stick to what we have put
11 into our statement.

12 CHAIRMAN IMBRECHT: Mr. McGuire, have you
13 been able to ascertain that question that I asked you
14 yesterday? Namely, what market share of the so-called
15 small companies represent...?

16 MR. MCGUIRE: I have not got a specific
17 answer, since the ten companies that are put up on the
18 chart over there. I do not know the exact companies
19 that were, since our statistics department picked
20 those. I did talk to our statistician; and, he said
21 that they do represent a significant share of the
22 market. But, in terms of the precise amount, he could
23 not give that to me.

24 CHAIRMAN IMBRECHT: My question remains.
25

1 What is significant? Is it 10%? 20%? 30? I mean,
2 even a ballpark idea?

3 MR. McGUIRE: Well, not being the ARI
4 statistician, I would guess that it is higher than 10%
5 for the ten companies. I would say that's probably
6 significant.

7 CHAIRMAN IMBRECHT: I guess the other
8 question in terms of impact, even your chart that
9 showed 8.5, if I recall correctly, there is only one
10 company that has 50% of its product line meeting that.
11 And most of them actually were down in the 20% level.
12 I would have to say that the comparison of those two
13 charts, I did not find persuasive in terms of the
14 suggestion. There would be a dramatic difference in
15 terms of impact of redesign on those companies between
16 8.5 and 8.9. I mean, as a practical matter, over half
17 of the product line of all those companies would have
18 to be redesigned, in any case. And I guess the
19 question I would ask is: If they are going to be
20 redesigned at 8.5, why is it so dramatically different
21 for them to be redesigned at 8.9?

22 MR. McGUIRE: I think there would be added
23 expense to go to the 8.9 level. And you are
24 redesigning, virtually, all the product line, which I
25

1 think is more significant than owning a percentage of
2 it, even if it is 50%.

3 CHAIRMAN IMBRECHT: I'd suggest you overlay
4 those two charts. There is not a dramatic difference,
5 it seems to me. My personal viewpoint is -- and I'm
6 not going to be redundant about this -- it remains the
7 same relative to second tier standards. And I have
8 expressed that on numerous occasions. But, in terms of
9 first tier, I'm not sure those charts really convince
10 me that there is a substantial contrast in terms of the
11 impact on small companies between 8.5 versus 8.9.
12 Since, as a practical matter, the majority of the
13 product line would have to be redesigned, in any case.
14 I will leave it at that. Alright. Further questions
15 for Mr. McGuire? Thank you very much.

16 MR. MCGUIRE: Thank you.

17 CHAIRMAN IMBRECHT: Mr. Ted Baily,
18 representing the Carrier Corporation.

19 MR. BAILY: Good morning, Mr. Chairman,
20 members of the Commission. I'm Ted Baily with Carrier
21 Corporation.

22 Carrier submitted considerable testimony as
23 this proceeding has gone on. And I do not intend to
24 recapitulate what we have already said. But, merely to
25 go on record as being in complete and full support of

1 the Committee's recommendation to establish energy
2 efficiency standards for heat pumps and three-phase
3 equipment in 1988 and 1993 at the levels proposed. Our
4 only concern that would not be in complete support
5 would be the recommendation for Alternative 3 on the
6 heat pump heating mode, the HSPF values. And we have
7 information on record with you on that, as well.
8 However, there were a few additional thoughts that I
9 felt might be well to put on the record. And if
10 someone could help me to pass this out, I would just
11 like to have you each have this brief statement in
12 front of you as I read it.

13 "Carrier Corporation is on record in this
14 proceeding in support of the Appliance Programs
15 Committee's Alternative 3 for Heat Pump Heating Mode
16 Standards. Our reasons, in addition to prior comments
17 are: 1) 6.6 HSPF, coupled with 8.9 SEER, would
18 increase the complexity of any redesigning which might
19 be needed to meet the 1988 standard. This could have
20 peculiar particular impact on small and medium-sized
21 manufacturers. 2) An HSPF level which is too high in
22 relation to the SEER requirements has the potential to
23 raise equipment cost to consumers if HSPF becomes the
24 dominant design criterion. 3) A four-tenths spread,
25 that is, 6.4 to 6.8 HSPF, between the 1988 and 1993

1 requirements, is consistent with the 8.9 to 9.9 SEER
2 cooling mode spread. Two-tenths is not. As you may be
3 aware, the American Society of Heating Refrigeration
4 and Air Conditioning Engineers voted this week, in
5 Honolulu, to send out for public review and comment,
6 the proposed revisions to ASHRAE Standard 90. The
7 values that they used were for 1998, 8.9 SEER and 6.4
8 HSPF. For 1992, 9.5 SEER and 6.6 HSPF. The ASHRAE 90
9 Committee felt that a 7.0 HSPF for 1992 was
10 inappropriate to set at this time, and that a four-
11 tenths differential was consistent with the SEER values
12 proposed. Carrier respectfully urges the Commission to
13 consider the adoption of Alternative 3.

14 CHAIRMAN IMBRECHT: Commissioner Crowley?

15 VICE CHAIR CROWLEY: I have a question on
16 your presentation paper. I don't understand that 6.4
17 by ASHRAE to 6.6 is a four-tenths differential. And
18 I'm confused.

19 MR. BAILY: That's a very good catch of a
20 typographical error, Commissioner Crowley, that I'm
21 sorry that we made. That should be 6.8....

22 VICE CHAIR CROWLEY: Thank you.

23 MR. BAILY: ...as is stated up above at the
24 beginning of Paragraph 3. Thank you for correcting
25 that error. I sometimes look at things without my

1 glasses and sometimes look at them with; and, they
2 still get by. Thank you.

3 MR. BAILY: I do have a couple of other brief
4 comments. The first has to do with product
5 availability. We heard some comment made on that
6 subject this morning. I have heard other comments made
7 throughout the proceedings. I cannot speak for other
8 manufacturers in terms of being able to have--able and
9 willing, I guess I should say--product available in the
10 California market which meets the standards on the date
11 of effectivity, or they were manufactured before that
12 date. But, as we have said before in previous
13 proceedings, Carrier will be glad to supply all of the
14 equipment the California consumers require at the
15 mandated standards level at the time of effectivity.

16 CHAIRMAN IMBRECHT: I'm sure you would.

17 MR. BAILY: Thank you very much,
18 Commissioner. As yet, however, our competition has, by
19 no means, allowed us to make good on those promises;
20 nor, do I expect that they will in the future.

21 The last item that I'd--the next to the last--
22 -that I would like to touch briefly on is the matter of
23 equipment life, which as we all recognize, is a very
24 important factor in the equation to determine consumer
25 cost effectiveness. As a matter of fact, I understand

1 that equipment life is receiving a great deal of
2 comment lately. And there is a considerable disparity
3 of opinion as to how long one might expect a heat pump
4 of today's generation to last in normal use and service
5 and maintenance by consumers. We agree, as we have
6 right along, during the Air Conditioning and the Heat
7 Pump proceedings, that 15 years is an entirely
8 reasonable and justifiable level to use in this type of
9 analysis. We believe that the Alabama Power Company
10 Study, which you have an opportunity to review on the
11 record, gives us, for the first time, a detailed and
12 definitive study as to what actually happens in the
13 installed situation where it was to possible to measure
14 the life of heat pumps by a utility.

15 Manufacturers, in addition, have supported
16 the 15 years criterion. And I would like to read you
17 three letters along that long, all from major
18 manufacturers. And, again, if I could have some help,
19 Bill, I would like to pass these out to the Commission.
20 The way they are stacked up is in inverse order to the
21 order which I would like to present them, going from
22 the back. And then, I will to begin until you have
23 your copies.

24 At the back of the collection is a letter
25 from Carrier Corporation, dated May 20, 1983, written

1 by myself to Michael McGrath of the Edison Electric
2 Institute, which is consistent with the comments of
3 Carrier Corporation at the Air Conditioning and Heat
4 Pump proceedings.

5 "Dear Mike:

6 We share your concern over the
7 Median Years shown on Table 1,
8 "Equipment Service Life" in Chapter
9 45 of the 1980 ASHRAE Handbook.
10 Our specific concern is over the
11 ten years shown for residential air-
12 to-air heat pumps, particularly
13 when one compares that estimate to
14 the 15 years shown for residential
15 single or split package units.

16 At Carrier, the design life
17 standard is identical for
18 residential air conditioners and
19 residential heat pumps."

20 The second letter, also written to the Edison
21 Electric Institute, is by Robert L. Stevens, Vice
22 President of Marketing for Lennox Industries, Inc.
23 Many of you know Bob, who has been part of these
24 proceedings in the past.

25 "Dear Mr. McGrath:

1 The ASHRAE Volume, "1980
2 Systems," lists the expected of
3 residential air-to-air heat pump as
4 ten years.

5 The information and surveys used
6 to arrive at that ten-year number
7 are seriously outdated; and, the
8 number is no longer representative
9 of the life of today's heat pumps."

10 If I didn't mention it, May 3, 1983, was the
11 date of the letter. And that was the "today" of that
12 letter time.

13 "We do not have definitive
14 information of the exact life of
15 today's heat pumps, but the design
16 of a modern air-to-air heat pump
17 takes in to account the extra
18 stresses expected in heat pump
19 applications and we would expect a
20 modern air-to-air heat pump to have
21 a life similar to that of an air-
22 cooled air conditioner of equal
23 quality."

24
25

1 The last letter is one dated May 16, 1983,
2 from Crane CAC, Inc. in Tyler, Texas. And it was
3 written by Mr. D.E. Bronaugh, B-R-O-N-A-U-G-H.

4 "Dear Mr. McGrath:

5 We feel the heat pump life
6 number used in Chapter 45 of ASHRAE
7 Handbook, ten years, should be
8 increased to reflect latest
9 information and current products
10 being sold. According to a survey
11 published in Appliance Magazine
12 (September 1981), the life
13 expectancy of heat pumps in
14 straight cooling systems is
15 approximately the same (14 years
16 for heat pumps and 13 years for
17 cooling systems).

18 These numbers support our
19 findings on industry products built
20 and installed in the 60s and early
21 70s. However, there are several
22 reasons to believe that todays heat
23 pumps (add-on or conventional) may
24 be better than prior products.
25

1 First, reliability is strongly
2 influenced by the quality of the
3 installation and maintenance
4 procedures of the dealer.

5 Beginning in the mid-70s, the
6 industry began to emphasize ongoing
7 heat pump programs aimed at
8 upgrading the skills of those who
9 install and service our equipment.
10 Prior to that period, GE and
11 Westinghouse had been the primary
12 participants in this market.

13 Second, the significant redesign
14 of heat pumps have occurred in the
15 industry since 1978, which has
16 upgraded the efficiency and quality
17 of products. Such things as new
18 compressors, new defrost components
19 and improved heat exchanges have
20 been introduced.

21 A point worthy of note
22 concerning heat pumps, is that
23 hermetic compressors very seldom,
24 if ever, wear out. (And, the word
25 wear is underlined.) The fact that

1 a heat pump compressor runs many
2 more hours than a cooling system
3 has little significance insofar as
4 compressor failures are concerned.
5 Compressors will occasionally "burn
6 out" due to external causes, or
7 possibly an internal defect in the
8 windings or the cabinet or outdoor
9 foil may eventually corrode.
10 Neither of these is directly
11 related to hours of operation.

12 In short, the life of 15 years
13 may more accurately project an
14 average life of today's heat pump
15 and cooling systems for the purpose
16 of life cycle cost analysis.

17 Sincerely,

18

19 D. E. Bronaugh

20 This, very briefly, is a final point. I
21 would like to agree with Mr. McGuire that in the event
22 or whether or not the Commission adopts HSPF and SEER
23 for three-phase equipment, that is something that the
24 members of ARI, if they so choose, can do, and
25 presumably, would do with the adoption of those

PAPERWORKS

1 criterion.

2 Thank you very much for the opportunity to
3 speak this morning. I appreciate it.

4 CHAIRMAN IMBRECHT: Thank you. Are there
5 questions for Mr. Baily? Thank you very much. Peter
6 Miller, representing the Natural Resources Defense
7 Council.

8 MR. MILLER: Good morning, Mr. Chairman,
9 Commissioners. Thank you for the opportunity to speak
10 before you today. I am here representing Natural
11 Resources Defense Council. And I will make my remarks
12 brief.

13 I would like to urge adoption of the
14 revisions contained in the Presiding Member's Report
15 for three-phase central air conditioners and for heat
16 pumps. We find that higher standards than those
17 recommended in the Report are fully justified, are cost
18 effective and feasible for manufacturers. But we
19 recommend that the Commission adopt the standards
20 recommended in the Report for reasons of ease
21 implementation and market equity. These new standards--
22 --these new revisions--will supplement and complement
23 the air conditioner standards which were passed in
24 December of '84, and, again, ensure market equity in
25 California.

1 I've outlined in my remarks today--in my
2 written comments--a number of issues that we've covered
3 in the past. And I will just not talk about those
4 today, and rather if you have questions, you can ask me
5 afterwards. Two new issues that I discussed are on
6 heating side levels and on the heat pump lifetime
7 issue.

8 As for the heating side, the HSPF levels, we
9 feel that that is an important side, of course, because
10 of the significant energy use used by heat pumps for
11 heating. Two approaches...one approach the staff used
12 for determining what the proper heating side level
13 should be is the regression analysis that they used
14 which found an HSPF of 6.6 and 7, corresponding to the
15 8.9 and 9.9 SEER levels. A second approach that we
16 carried out is to look at the fraction of models that
17 meet the HSPF levels and try and set a similar...try
18 and establish an HSPF level that allows the same
19 fraction of models, meaning the SEER levels. In other
20 words, if 35% of available models meet an 8.9 SEER
21 level, what is the HSPF level at the same fraction
22 meet? That analysis comes up with a 6.8 and a 7.4 HSPF
23 level, which are significantly higher than the ones
24 recommended through the regression analysis that the
25 staff carried out.

1 Both of these approaches tend to indicate
2 that the Committee recommended 6.6 and 6.8 are quite
3 reasonable and conservative. And they allow
4 manufacturers a reasonable space in which to redesign
5 their equipment so that the heating side is not the
6 forcing side. And at the same time, they don't allow
7 too large of a drop in energy savings. So, we do
8 recommend compliance. We support the Committee Report.

9 The second issue is the Alabama Power and
10 Light Study and its impact on the Commission's
11 determination of heat pump lifetimes and the role of
12 that determination in the cost effectiveness
13 calculation. The Alabama Power and Light Study looked
14 at a thousand heat pumps in their service territory and
15 found a median of 20 years, which actually corresponds
16 to a mean age of greater than 20 years, if you assume
17 an exponential decay. They found that all heat pumps
18 lasted...virtually, they all lasted greater than ten
19 years. And approximately 75% lasted more than 15
20 years.

21 The Study is being vigorously debated at the
22 ASHRAE Conference. And we recommend it's taken with a
23 grain of salt. First of all, because it is only
24 corroborative evidence to finding of design life that the
25 Commission is mandated to make. Second of all, because

1 it isn't completely reviewed. With that in mind, we
2 note that the debate on the study is whether it shows
3 lifetimes of 15, 20 or 25 years, all of which show the
4 Committee the staff use of 15 years to be either
5 conservative or accurate. So, we feel that 15 years is
6 a well supported number.

7 In conclusion, I just want to note that this
8 is a very important issue, of national if not
9 international significance. In recognition of that, I
10 have handed out a New York Times editorial from
11 yesterday's paper, which specifically mentions the air
12 conditioner standards and commends California as a
13 leader in a new and appropriate means of supplying
14 energy needs. I think that's a big step for New York
15 to recognize California as a leader. And I think it's
16 a sincere compliment to the Commission.

17 One last point and this regards the computer
18 issue that came up. We are actually working right now
19 with DOE. DOE has issued a proposed ruling for
20 television sets. And we're submitting comments which
21 do deal with the issue of whether or not that includes
22 computer terminals; because, we feel it does have the
23 chance for it being a significant use of energy in the
24 future.

25

1 Thank you for the opportunity to present our
2 comments today. And I would be happy to answer any
3 questions.

4 CHAIRMAN IMBRECHT: Alright, thank you. Any
5 questions? Thank you very much. Mr. Marshall Hunt,
6 representing the Davis Energy Group.

7 MR. HUNT: Good morning. I just have a brief
8 comment somewhat akin to Gene Varanini's comments, but
9 relates to how does someone, such as ourselves, working
10 with builders in a compliance business do the trade-
11 offs that we now do, in light of the standards which
12 have raised the efficiency required for the heat pump
13 or the air conditioner, thereby eliminating one of the
14 areas of trade-off. It seems to me the interaction
15 between the Building Standards and the Appliance
16 Standards needs to be not put off to the future, but
17 decided somehow as a matter of this process. Because I
18 believe that, even though it's a couple of years away,
19 it will create confusion in the marketplace; and, we do
20 need all the trade-offs we can get for the most cost
21 effective response to the standards. And, at present,
22 I don't see how that works.

23 CHAIRMAN IMBRECHT: Maybe you can delineate
24 that problem for me a little more clearly, if you
25 would, please.

1 MR. HUNT: Let's say I'm looking at a client
2 that's building and just over the hill in Orinda or
3 something, and they are trying to trade-off as to
4 between whether they should have extra insulation in
5 the attic, whether they should do shade screens,
6 whether they should do under floor installation,
7 whether they should do high efficiency equipment. If
8 the Standard--the Appliance Standards suddenly
9 eliminate, for all practical purposes, the options of
10 the equipment efficiency increase, which is usually the
11 range we are talking about here, the new standards as I
12 read them for '88, that's an increment of efficiency
13 which is fairly cost effective, as a trade-off against
14 other things.

15 So, here I'm telling this builder that:
16 "Well, you can comply this way or this way." But
17 suddenly if I now have to always put in a certain level
18 of air conditioning efficiency, I have eliminated that
19 trade-off. And necessarily, other things will come out
20 of the house. And it could have a negative impact on
21 peak. Now, you find a situation where you upgrade the
22 efficiency of the air conditioning and you maybe take
23 out installation or take away shade screen. And we
24 might end up with a strange situation, which would
25 still have us complying with the high efficiency

1 equipment as required. That may not be the most cost
2 effective and may not even be the best for peak.

3 When we were looking at this with consultants
4 to SMUD's Passive Solar Program, we at one time, had a
5 peak requirement on all buildings who got the award,
6 which you might have seen in the local papers. That
7 was the most direct way we had of saying if you are
8 going to be an award-winning house, you need to have a
9 certain peak demand and no more, in kilowatts. So,
10 it's really difficult to get into peak through the air
11 conditioning standards. And I am concerned about my
12 clients and how do we trade these things off for real
13 people, for the builder.

14 CHAIRMAN IMBRECHT: Okay. I'm going to
15 return to that in a few moments. But I appreciate
16 that.

17 MR. HUNT: Thank you.

18 CHAIRMAN IMBRECHT: Alright, Mr. Ted Gilles,
19 Lennox.

20 MR. GILLES: Thanks, Mr. Commissioner,
21 Chairman. Dave Lewis will be handling our main
22 presentation.

23 MR. LEWIS: My name is Dave Lewis. And I am
24 Corporate Director of Product Marketing for Lennox.
25 Our discussion, this morning, for this hearing,

1 pertains primarily, or I would say the most pertinent
2 information, pertains primarily to the assumptions and
3 conclusions that the staff has arrived at in their
4 Staff Report. And some of the conclusions we believe,
5 because there are some very specific mathematical
6 errors within the charts and tables, that appear within
7 the Staff Report, definitely cast a shadow of doubt
8 upon the whole issue that's before us this morning.

9 When we look at the Staff Report and their
10 Appendix I, we find that this particular item or this
11 particular Appendix is a very crucial element within
12 the whole Staff Report. Upon it hinges the cost
13 effectiveness analysis. Appendix I is entitled the
14 Derivation of Statewide Average Heating and Cooling Use
15 for Heat Pumps. It's already been noted that the
16 column entitled, "Weighting Using ARI Shipment Data" is
17 suspect. And that's due to the fact that it's claiming
18 to be ARI data but, in fact, is not ARI data. We have
19 no idea where this information was gathered from. But
20 the very fact that it says 'ARI data' and a spokesman
21 at two hearings for ARI has mentioned that it's not ARI
22 data. And the importance of this column is that the
23 ARI data here or the weighting of the shipment averages
24 keys into the heating energy use by climate zone, which
25

1 effects the weighted heating use average for the entire
2 State of California.

3 Now, in the staff's comments, dated June 19,
4 their response is that they believe it is ARI data. I
5 would guess we would say either it is or it isn't. And
6 if ARI clearly has said that it isn't, then we would
7 question on what basis a new standard level could be
8 arrived at with information that's inaccurate.

9 We would further delve into Appendix I in
10 looking at the heating energy use by climate zone. One
11 of the striking elements of this Appendix is that
12 Sacramento is, we believe, is overly weighted to that
13 of the other 15 climate zones within the State of
14 California. In fact, Sacramento's demand in the
15 weighting method that was used by the staff, weights
16 Sacramento 47% of California's total.

17 When you.... If you were to look at an area
18 such as Fresno, one could find that the annual degree
19 days or the number of heating days in Fresno actually
20 exceeds the heating days that are here in Sacramento.
21 Yet, the heating energy use by climate zone weights
22 Sacramento or clearly shows Sacramento as having more
23 of a heating energy use than does Fresno. Yet,
24 Sacramento is given 61% more weighting in the total
25 heating use than Fresno. This clearly shows that this

1 table is suspect. Now, the information that we are
2 using as far as saying that Fresno has greater heating
3 use than Sacramento is not just an arbitrary figure on
4 our part. But it's based upon the ASHRAE Fundamentals
5 Handbook. In the ASHRAE Fundamentals Handbook, we find
6 that Fresno has 2,611 degree days, while we find
7 Sacramento has 2,502 days.

8 CHAIRMAN IMBRECHT: You wouldn't know it by
9 living here. Excuse me. That's a coastal boy talking.
10 Pardon me.

11 MR. LEWIS: We believe the important item
12 here that we are presenting is that what this would do
13 is, it would discriminate anyone living outside of
14 Sacramento that purchased a heat pump that was put into
15 place or whose efficiency was set by a new level of
16 standard that this Commission is considering. In other
17 words, someone living in Los Angeles or living in San
18 Francisco would be buying a heat pump that really would
19 not be cost effective to that person, due to the
20 unequal weighting of Sacramento. So, as a result of
21 Appendix I being weighted incorrectly, this carries
22 over to Appendix J and actually carries through the
23 entire staff document, appearing also in the effect...
24 Its effect appears also in Table 20.

25

1 CHAIRMAN IMBRECHT: It might be useful, if it
2 wouldn't be too disruptive for your testimony, if we
3 can ask Mr. Pennington or Mr. Messenger, since you are
4 raising some substantial questions about technical-
5 ities, if either of them are in a position to respond.
6 Maybe you can take a seat next to Mr. Smith and let's
7 try to confront this issue directly.

8 MR. MESSENGER: Well, just let me try to give
9 you a perspective here. What we are talking about is
10 the method used to weight the energy use expected for
11 heat pumps in each one of the climate zones in
12 California. We actually looked at three different
13 methods. And under all methods, the standards turned
14 out to be cost effective. We used the disputed ARI
15 data. We used census data. And we used a compromise
16 between the census data and the ARI data. And we used
17 some independent weightings that came up by Mr. Wolf of
18 the Trane Company.

19 Now, in each of those weighting methods,
20 there is a variance in terms of how many, what
21 percentage of the heat pumps in California are
22 projected to be in Sacramento. And the variance ranges
23 from 20% to 28%. But, no matter which one you use,
24 whether you use 20% or 28%, it still turned out to be
25 cost effective in all cases. In fact, the ARI case is

1 the most conservative case in that it derives the
2 lowest number in terms of a baseline energy use. If we
3 were to use, for example, census data or Trane
4 information, we would have come up with a higher energy
5 use, higher savings and more dollar savings to the
6 consumer over the life cycle of the product.

7 I believe Dave slightly misquoted the table
8 that you see there. The table shows that there's 28%
9 of the heat pumps in California for Sacramento, not
10 47%. And if you look at the census data, it shows that
11 the weighting used for the Sacramento pilot zone is
12 22%. The reason that there are so many heat pumps in
13 Sacramento is fairly obvious. We have relatively low
14 electricity rates here. We have a high heating and
15 cooling load. And it's an ideal situation for heat
16 pumps to be marketed. In fact, Sacramento represents
17 roughly a quarter of the heat pumps going into the
18 state.

19 He also made another statement that in areas
20 besides Sacramento, it would be not cost effective. In
21 fact, our analysis showed that in 12 out of the 15
22 climate zones in the State of California, it was cost
23 effective. So, I don't understand how we came to that
24 conclusion.

25

1 I think that's enough for now unless you
2 would like for me to talk about degree days and models
3 and that sort of thing.

4 CHAIRMAN IMBRECHT: Well, let's get a response
5 here..

6 MR. LEWIS: Arriving.... First of all, the
7 47% is an accurate figure. The 1108.08 kWh Heating Use
8 Weighted....

9 CHAIRMAN IMBRECHT: Would you give me the
10 page number, again, you are on?

11 MR. LEWIS: Yes. It's Appendix I, Page 1.
12 The figure 1108.08 is 47% of the average figure found
13 at the bottom of that column, 2,360.

14 COMMISSIONER COMMONS: One second. You are
15 ahead of me. Appendix I, Page 1?

16 CHAIRMAN IMBRECHT: It just says I-1 down at
17 the bottom of the page.

18 COMMISSIONER COMMONS: I see. I found it.
19 Thank you.

20 MR. LEWIS: Sacramento, which is shown on the
21 fourth column over, second from the end, Heating Use
22 Weighted kWh, 1108.08 is 47% of 2,360. My calculation
23 is not incorrect. Secondly, again, it's being referred
24 to as ARI data. Now, I have to believe that if there
25 is a reason for setting the proposal as the staff and

1 Committee has, if there are reasons available, then
2 surely those reasons are presented within the staff
3 documents that are referenced within the NOPA itself.
4 It seems odd to me and it seems like a very easy way
5 out to make a comment that: 'We have made other runs
6 and those runs have shown cost effectiveness.'

7 I think the point is that this document
8 before us is entitled the "Derivation of Statewide
9 Average Heating and Cooling Use for Heat Pumps." And
10 that Appendix I continues over to Appendix J, the next
11 sheet, which shows the statewide average energy use and
12 projected savings. Under 8.0 SEER Baseline Use for
13 Heating you see for both Single Package and Split
14 System, 2,360 being used. And that's Page J-1. My
15 reason for pointing this out is the numbers that were
16 arrived at in Appendix I continued to Appendix J and
17 then are referenced and are even used specifically in
18 the other tables.

19 CHAIRMAN IMBRECHT: Okay. If that's your
20 point, let's try to resolve these discrepancies in
21 numbers. Mr. Messenger, I see Mr. Lewis' point.

22 MR. MESSENGER: No. Okay. I'm going to
23 refer specifically to Page I-1. And what we are
24 looking for is what percentage of the heat pumps is
25 being used to weight the various predicted energy uses

1 to come up with a statewide average. If you would look
2 at that, if you would look under Sacramento, the number
3 used there is 28.2%.

4 CHAIRMAN IMBRECHT: Okay. I see that. But
5 then, of course, he indicated that when you look at the
6 heating use weighted by kilowatt hours, that's 1,108
7 and it would just....

8 MR. MESSENGER: That's not a function of the
9 number of heat pumps or the weighting. That's a
10 function of the fact that Sacramento happens to have
11 more degree days than other climate zones. So, the sum
12 of that number in Column 2 times the number in Column 3
13 does, in fact, come to 47% of the weighted average.
14 But, that doesn't mean that 47% of our estimate is
15 being affected by Sacramento.

16 MR. LEWIS: But, the point that we are making
17 is Sacramento doesn't have more degree days. Secondly,
18 the 28.2 figure, which this whole item is being
19 multiplied by to arrive at a heating use weighted kWh,
20 is inaccurate to begin with. Further, the 3,930 figure
21 which is under the column entitled "Heating Energy Use
22 by Climate Zone," is also inaccurate, based upon the
23 amount of degree days found here, as opposed to other
24 areas. And we referenced in our report, Fresno, as an
25 example, having more degree days than Sacramento. And

1 yet, the table, itself, does not indicate that. So,
2 there are a number of suspect items.

3 CHAIRMAN IMBRECHT: Mr. Messenger.

4 MR. MESSENGER: Okay. Let me, again, try to
5 state this. There are three methods that we can use
6 for weighting heat pumps. One was using data provided
7 to us by Carrier, which Carrier told us was ARI data.
8 We believe Carrier. We don't know to what extent
9 Courier and ARI are communicating or not communicating.
10 But we received the information from Carrier. We
11 didn't just sort of make this data up as was alleged.

12 CHAIRMAN IMBRECHT: Mr. Messenger, I have to
13 say quite candidly -- I mean, I think it's the only
14 proper way to respond. I mean, if ARI disavows this as
15 ARI data, that's, as far as I'm concerned, definitive
16 of the issue, as to whether it's ARI data. The fact
17 that it came through another source and is referenced,
18 in essence, it is like hearsay testimony, frankly.

19 MR. MESSENGER: My understanding, and I may
20 be wrong, is that ARI did not provide the data to the
21 docket; thus, it's not ARI data. But, that Carrier
22 used ARI data that it provides to its member companies
23 to come up with this information.

24 MR. LEWIS: As a member company of ARI, we do
25 not report such information to ARI. The only way ARI

1 could get such information is from its member companies
2 reporting area information. There isn't such a
3 breakdown, by city or by climate zone, as far as
4 shipment averages.

5 MR. MESSENGER: For the sake of argument,
6 let's assume the ARI data is all wrong. We also did an
7 independent analysis based on census data which showed
8 higher savings and higher costs.... Excuse me, higher
9 cost effectiveness to the consumer by looking at the
10 heat pumps that were installed in each city in the
11 State of California. We used the ARI number because we
12 thought it was a more accurate reflection of what the
13 industry perceived as shipments. However, the census
14 data (which is also available) leads to higher savings.

15 The second table that I point out is that
16 heating use is not critical in this calculation.
17 What's critical is the cooling savings because they
18 predominate for heat pumps. We have also done a
19 sensitivity analysis that says, let's assume that you
20 don't even realize half of the savings. Let's assume
21 that all of our models are incorrect and we are only
22 going to get half of the savings that are being
23 calculated. It is still cost effective using that. It
24 is also cost effective if you get no heating savings as
25 a result of these standards. So, we were confronted

1 with a variety of different estimates, census, ARI. We
2 chose the most conservative one which was ARI. It lead
3 to the lowest number of savings. And if, in fact, ARI
4 doesn't.... If we come up with information that
5 suggests that all the ARI data is not useful, then we
6 simply go back to the census data or any of the TRANE's
7 estimates.

8 CHARIMAN IMBRECHT: I think for purposes of
9 the record, it should not be referred to as ARI data.

10 MR. MESSENGER: Okay. Excuse me, the data
11 we....

12 CHAIRMAN IMBRECHT: Refer to as Carrier
13 supplied data that is represented as being ARI. I'm
14 curious. There are a couple of things that leaped out
15 at me. I understood your explanation as to the
16 weighted percentage of heat pumps in Sacramento. Why
17 is Pasadena so high?

18 COMMISSIONER COMMONS: That's that whole
19 climate zone, Mr. Chairman. It's not just Pasadena.

20 MR. MESSENGER: It's a high cooling load in
21 the San Fernando Valley.

22 COMMISSIONER COMMONS: That's most of the San
23 Fernando Valley and most of this San Gabriel Valley and
24 extends south to near Orange County. That's just one
25 city out of the climate zone.

1 MR. LEWIS: I guess we have to continue to
2 respond that we cannot analyze data presented by the
3 staff, verbally. We have to see what the staff has
4 done. And if Appendix I is the Derivation of Statewide
5 Average Heating and Cooling Use for Heat Pumps, we have
6 no other way to proceed except to analyze the
7 information that is presented within the Staff Report.

8 When you look at the heating energy use by
9 climate zone, one finds that 3,930 is the number used
10 for Sacramento. And 2,523 is used for Fresno. And
11 that disparity does not correlate to or, actually, it
12 does correlate to the exact opposite that's found in
13 ASHRAE. In ASHRAE, Fresno has more heating days than
14 Sacramento. And yet here in the staff document, Fresno
15 is shown as having less than Sacramento.

16 COMMISSIONER COMMONS: Dave, let me ask you a
17 question on that.

18 MR. LEWIS: There was one other, just real
19 quick, comment. Mike made the comment that heating
20 really didn't matter. I just want you to think about
21 that for a moment. This is called a heat pump. I
22 don't understand such reasoning. Heating does matter.
23 It's part of the overall cost effectiveness analysis.

24 COMMISSIONER COMMONS: Let me ask you a
25 question. The 3,930 looks high to me on the heating

1 side. Clearly on the cost, the cooling numbers, as
2 Mike said, are more important. But one of the issues
3 that is in the Presiding Member's Report is actually
4 the level of HSPF. And this would somewhat overstate
5 or overestimate if this number were high, the benefits
6 from the HSPF and would tend to argue for either the
7 Presiding Member's June 6 reduction of the HPF or even
8 the June 12th further reduction that was argued by
9 Carrier. And that it would tend to keep the cost down
10 on the heating side, which you are saying that these
11 numbers would overestimate the savings on that heating
12 side, so we should not adopt the high HSPF numbers.
13 That would be the direction, I think, this argument
14 would lend itself. I'm trying to understand where you
15 are going with this potential....

16 MR. LEWIS: Yeah. Where I'm going is that if
17 the Carrier data which is labeled 'ARI Data' is, in
18 fact, incorrect, which we believe it to be, it equally
19 affects the cooling as the heating. We are bearing a
20 point of information on the heating aspect. But that
21 is part of the equation that they used to come about
22 with a statewide average. Everything is based on that
23 weighted ARI shipment data according to the title of
24 the title of the column.

25

1 COMMISSIONER COMMONS: Well, but I'm looking
2 at the number that has been in question. I look at the
3 cooling side and it actually shows on the cooling side,
4 Sacramento requiring less than Pasadena.

5 MR. LEWIS: Yeah. Okay.

6 COMMISSIONER COMMONS: And that's just not
7 correct. On the heating side, I can't believe
8 Sacramento's as high as it is.

9 MR. LEWIS: Let me respond a little more
10 clearly. This particular chart does not really show
11 how the numbers were arrived at. But what actually
12 happens is, the "Weighting Using ARI Shipment Data"
13 column is multiplied by the heating energy use by
14 climate zone column. And then the "Heating Use
15 Weighted kWh" is arrived at. Also, for the cooling,
16 the weighted information or shipment data is multiplied
17 with the cooling to arrive at cooling information. So,
18 what we are saying is the problem with this whole
19 Appendix is not just one-fold, but multi-fold.

20 MR. GILLES: That's correct, Commissioner
21 Commons and Chairman Imbrecht. I did most of this
22 analysis, along with the support of our scientific data
23 processing group. And the reason we zeroed in on this
24 is the fact that Table 20 on Page 40 is your baseline
25 case. We don't have infinite time to continue to prove

1 the technical aspects of staff reports. We submitted
2 four reports, last year, during the air conditioning
3 hearings that time after time documented errors that
4 came out of staff. We just don't have infinite time to
5 go ahead into these analysis. If the baseline's wrong,
6 we see no substantive value to proceed into other
7 scenarios. And we contend that this baseline is
8 totally wrong.

9 CHARIMAN IMBRECHT: Alright. Mr. Messenger.

10 MR. MESSENGER: Yes. I'd like to direct the
11 Commission's attention to Page 42 first, in which we
12 did a sensitivity analysis and Table 23. Basically,
13 what that says is that if we decided that, for whatever
14 reason, our computer models were wrong or the ARI was
15 wrong or whatever, and we would reduce, let's say, 39
16 to 80 kWh in half as a baseline ease; we took that down
17 to 1,800, and only achieved half of the savings that
18 all the models project, would it still be cost
19 effective? The answer is 'yes.' We did that because
20 we wanted to be absolutely sure that no matter, under
21 what types of uncertainties that might combine, you
22 would still be leading to a cost effective standard.
23 That's the first point I wanted to make.

24 The second point I wanted to make is that we
25 presented this information in late April. And we asked

1 for technical comments at a hearing that the Committee
2 had in May 24 -- roughly a month ago. None of this
3 information that Lennox is bringing before you now was
4 brought up. Their tactic is to bring in information on
5 the last day and attempt to discredit analysis without
6 actually providing specific information. This is a
7 consistent tactic that has been used. And it is not
8 helpful to the Committee nor the Commission, in my
9 opinion.

10 MR. LEWIS: Probably....

11 MR. MESSENGER: The second.... Could I
12 finish?

13 CHARIMAN IMBRECHT: Mr. Messenger, it's not
14 your position to be offering that kind of an opinion at
15 this hearing.

16 MR. MESSENGER: Okay.

17 MR. GILLES: Agreed.

18 MR. MESSENGER: I'm sorry. I beg you apology.
19 Excuse me.

20 MR. LEWIS: Probably, if I was sitting in his
21 position, I probably would say the same thing. But
22 let's look at the facts. We received this document on
23 May 14; and, there was a hearing. I think it as May
24 24. Is that correct?

25

1 COMMISSIONER NOTEWARE: Yes, I believe it
2 was.

3 MR. LEWIS: There was not adequate time to go
4 through all the items that are contained in the Report,
5 adequately, in that period of time. We don't have the
6 resources for people to sit there and crank on the
7 computer to find out even...since the information is
8 not explained even as to how its arrived. Look at Page
9 42 for an example. On what basis...? They are nice
10 tables; but, what is the background for the tables?
11 Where does the information come from? We surely can't
12 sit down and assume that this information is accurate
13 if the baseline case.... At least we can't
14 automatically say it's accurate without testing, if the
15 baseline case, itself, is inaccurate.

16 This is not a delaying tactic. It's not a
17 tactic of coming in the last hour. Actually, when you
18 take a look at the way we have receive information,
19 specifically on this rulemaking and the time
20 restraints, I think we have done very well to come up
21 with the information that we have presented. And we
22 are doing it in a sincere way, as we did throughout the
23 air conditioning hearing.

24 MR. MESSENGER: Mr. Chairman, if I might?
25

1 CHARIMAN IMBRECHT: The last one, then we are
2 going to take a luncheon recess.

3 MR. MESSENGER: Okay. Mr. Lewis raised a
4 rhetorical question of where the information, in terms
5 of how it came to our analysis, is available.
6 Basically, Pages 15 through 25 lay out, in great
7 detail, how we came to our analysis. And, in
8 particular, we discuss the weighting method used in
9 terms of both the ARI and the census data on Pages,
10 basically, 15 through...all the way through 30. So, we
11 think the information is in the record now.

12 MR. LEWIS: No.

13 MR. GILLES: Our total statement, Mr.
14 Chairman....

15 CHARIMAN IMBRECHT: I'm going to let you go
16 ahead and finish your statement.

17 MR. GILLES: Okay. Our total statement, that
18 is quite extensive, goes into many more errors and how
19 we found them. We found them.... By computer
20 iterations is how we found the errors; because, we knew
21 the answers weren't correct. And we go into that in the
22 whole statement. And it's a complex issue. But, we
23 are sorry that we end up in this continual adversary
24 situation. We honestly do. I personally do; because,
25 it gets tough between Mr. Messenger and myself. But I

1 think Commissioner Commons can attest to the fact that,
2 during the proceedings last year, the staff knew we
3 checked these numbers. So, when they put out
4 something, they realized they are going to get checked.

5 COMMISSIONER COMMONS: I'll attest to that.

6 MR. GILLES: Alright. Thank you, sir.

7 MR. LEWIS: I think also we haven't withheld
8 any information.

9 CHARIMAN IMBRECHT: Let me ask you: Do you
10 have a bottom line?

11 MR. LEWIS: Well, that's only one item.

12 CHARIMAN IMBRECHT: I understand. Well, why
13 don't you go ahead and complete your testimony. Do you
14 have anything else to add?

15 MR. LEWIS: Yes. Table 20 will be next.
16 Table 20.... Well, let's actually go to Table....

17 COMMISSIONER COMMONS: One second. We are
18 going to drop that topic. I want to see if we can pull
19 it together before you leave that topic, if you don't
20 mind.

21 CHARIMAN IMBRECHT: Alright. Fine. If you've
22 got a question, go ahead.

23 COMMISSIONER COMMONS: Dave, If I follow
24 through on what you are saying: if Sacramento were
25 roughly the same as Fresno, that would be on the

1 heating side. That would be about a 40% reduction in
2 the heating. That would reduce the.... Then you would
3 have to reduce the 1,108 by 40% -- the heating portion,
4 which would be about a 440 reduction which is an
5 overall net reduction on the heating side of
6 approximately 20%. And you would then have to go next
7 to Appendix J and you would have to reduce the heating
8 kilowatt hours by roughly 20% on both of those, in
9 terms of your cost effectiveness analysis, if your
10 statements were correct. That would be the appropriate
11 correction to make.

12 MR. LEWIS: Well....

13 COMMISSIONER COMMONS: Then you would have to
14 analyze based on that change.

15 MR. LEWIS: I would really enjoy it being so
16 simple; but, it's not. The biggest problem is that,
17 during the May hearing, the column entitled "ARI Data"
18 was identified as being in error. And any number on
19 the other columns that arrive at conclusions are
20 multiplied by that ARI shipment data. So, whatever
21 errors are contained with that shipment data, is
22 multiplied in its inaccuracy when it gets factored with
23 the cooling and heating days.

24 COMMISSIONER COMMONS: I'm just trying to....

25

1 MR. LEWIS: I know you're saying the heating
2 data....

3 COMMISSIONER COMMONS: I'm not saying you are
4 incorrect on your other statement or dropping it. I
5 was just trying to follow through on that one that
6 stands out.

7 MR. LEWIS: But, we.... That stands out
8 because it is the most dramatic. However, when you
9 look at the other data from the other climate zones,
10 you don't arrive at.... You are not comfortable saying
11 that the information here is representative of any
12 climate zone. I mean, like Pasadena, personally, I
13 mean, we can say as much as we want about how it
14 meanders through many mountains and hills; yet still,
15 that number does not look accurate to us. Mt. Shasta
16 does not look accurate to us. Eureka does not look
17 practical to us.

18 COMMISSIONER COMMONS: Okay. But, the one
19 thing on that column is if you drop Pasadena to 20, you
20 would have to increase something else by that same
21 percentage.

22 MR. LEWIS: Yeah. But we're....

23 COMMISSIONER COMMONS: It still has to add up
24 to 100.

25

1 MR. LEWIS: I guess I don't where such a
2 discussion will actually lead to; because, I don't
3 think there is any easy answer to the problem that
4 we've presented. I think it is going to demand some
5 time and analysis to correct. And until it's
6 corrected, there really isn't any way of going further.

7 COMMISSIONER COMMONS: Alright. One last
8 question, then. On the ARI shipment data which we are
9 now saying is not ARI shipment data, do you have any
10 data that you can provide us which would actually show
11 what you think is correct?

12 MR. LEWIS: Here's our difficulty. We do not
13 have any tracking method; nor, am I aware of any other
14 manufacturer. There may be some manufacturers. I
15 would say the majority of manufacturers do not have a
16 tracking method that allows them to pinpoint what
17 climate zone a unit ends up in. We are just not at
18 that point in our distribution and cycle that we
19 can....

20 COMMISSIONER COMMONS: But, then if we gave
21 additional time to try to resolve it, time wouldn't
22 help us. We still would not get that information?

23 MR. LEWIS: That is correct. We would
24 certainly be willing to provide some information. I
25 mean, I don't want to be giving the attitude like

1 here's a problem and we don't have anything to solve
2 it, but we're willing to supply information that we do
3 have available. It probably wouldn't be broken down to
4 the degree of each 16 climate zones, because that kind
5 of tracking is nearly impossible. But, census data
6 though, as far as where the population is within the
7 state, that is readily available.

8 CHARIMAN IMBRECHT: Well, obviously, you've
9 got some other points to make. I think we ought to
10 take a luncheon recess until 1:30. I hope that's not
11 too much disruption to interrupt your testimony. We'll
12 come back at 1:30, let you complete your testimony,
13 take the remainder of the witnesses, and then turn to
14 Commission discussion. Thank you.

15 (Whereupon the morning session of the
16 Business Meeting of the California Energy Resources
17 Conservation and Development Commission was adjourned
18 for a luncheon recess at 12:30 PM.)

19 --oOo--

25

AFTERNOON SESSION

---o0o---

1
2
3 CHARIMAN IMBRECHT: Okay. We'll call the
4 meeting back to order. If you would like to continue
5 your presentation. Thank you for your patience.
6 We're all ears.

7 MR. LEWIS: We would continue, then, as far
8 as our Report goes, on Page 4. Page 4 begins the
9 review of Tables 20 and 17. Within the Report, Table
10 20 is on Page 40 and Table 17 is on Page 36. Table 17
11 reports the staff's findings of the Weighted
12 Incremental Cost for equipment as the standard would
13 affect it. In other words, the incremental cost
14 increase by going to a higher efficiency level, based
15 from the 8.0 level. Now, it should be noted, I'm sure
16 you are aware that in Table 17, the single package
17 value of 103 under 8 to 9 SEER was changed by errata to
18 read 159.

19 As we analyzed these numbers -- now I'm
20 continuing on Page 5 of my report -- when we analyze
21 these numbers, we, first of all, just made a comment
22 there under.... We turn to Table 17 and we put an
23 asterisk by the corrected number of 159. Later on in
24 the report, we show how 159, in reality, should be 195.
25 In parenthesis beside each value, listed 1(a), 2(a),

1 3(a), and 4(a), which correspond to the four points
2 beneath in the report.

3 1(a) is obviously an incorrect value;
4 because, the numbers that were picked up from the ARI
5 submitted data, which appears in Appendix P, Page 1,
6 are different from what the numbers were evidently used
7 to bring about the conclusion of 199. For your
8 convenience, we have, on Page 6 at the bottom, shown a
9 corrected incremental cost table, using the staff's
10 procedures but used numbers that were, in their mind,
11 correct numbers to be employed, rather than using
12 numbers from wrong tables, as was done. Nowhere in the
13 document does it actually show how one arrives at their
14 reported \$199 figure for the split system going 8 to 9.
15 But we have, through some computer work, determined the
16 way that was found was by taking Carrier's information
17 that they control 22% of the marketplace, and
18 multiplied their cost increase (which is \$121) by that
19 .22 factor, which would mean that .78 of the
20 marketplace is not Carrier's. And what the staff did
21 is, from the ARI number showing in Appendix P, they
22 extracted wrong, incorrect information.

23 Now, the reason why we would spend time with
24 this is because one of the key factors in a cost
25 effective analysis is what is the weighted incremental

1 cost to go from the baseline that exists today at 8 to
2 the new level that is proposed. And then, actually,
3 since they are proposing two standards, the correct
4 method to proceed would be to show the cost
5 effectiveness on the 8 to 9 level and then show a 9 to
6 10 level, which was never done. But actually, what
7 they did instead was to take from an 8 to 9 level and
8 then an 8 to 10 level.

9 Well, be that as it may, even though that's
10 incorrect, the numbers that they show on Page 36 and
11 Table 17 are all inaccurate. I don't think that time
12 really...it would help us to go through each item,
13 unless specifically I would be requested to. It's all
14 written there. Each item is inaccurately computed.
15 Therefore, the weighted incremental cost in 1984
16 dollars for a 2½ ton unit is inaccurate throughout. We
17 think this is very important; because, that has much to
18 do with whether it is, as the statute requires, cost
19 effective to the consumer.

20 The errors, I believe, really illustrate the
21 lack of credibility contained throughout the Staff
22 Report. The information that they... They provided
23 information.... Carrier provided information on going
24 -- Carrier is on Page 31. Carrier provided incremental
25 price information. They did not show information going

1 from 9 to 10 in either single package or split system.
2 And neither showed the cost of going from 8 to 10 for a
3 single package as they did for a split system on Page
4 31. So, in every case for Table 17, which is really at
5 the heart of the issue, they did use the correct
6 Carrier number or value. But, in every case, they used
7 the wrong information on the ARI submitted information,
8 which appears in Appendix P.

9 Should I just continue? Or how do...?

10 MR. RAUH: I could venture a brief comment.

11 CHAIRMAN IMBRECHT: Sure, I think probably we
12 ought to take this in serial fashion -- take your
13 statements from the staff.

14 MR. RAUH: First of all, the Staff Report was
15 begun and the tables that have been referred to or
16 constructed with an original ARI submittal of cost
17 data. And, the staff had completed its analysis at
18 that time, when we received a second submittal from
19 ARI, which I believe is being referred to now as the
20 correct ARI costing data. On Page 43, Table 25 and
21 Table 26, the staff constructed a sensitivity analysis
22 with just the ARI revised data. And one sees both the
23 net savings impact change as a result of changing the
24 values. Basically, you can see from the sensitivity
25 analysis, that without including the proportion of

1 Carrier weighted sales in the state, as was done in the
2 staff's base case, the standards, just on ARI's revised
3 submittal data, are cost effective.

4 So, despite the references to earlier tables
5 that were constructed during the proceeding with the
6 original ARI submittal, staff recognized it could not
7 turn all those tables around in the timeframe of this
8 proceeding. But, did take the industry's new submittal
9 of information and did run additional sensitivities.
10 Because of the overwhelming cost effectiveness of the
11 improvement and efficiency, relying only on ARI's
12 additional submittal of data, the standards are still
13 cost effective. And that's what Tables 26 and 25
14 display.

15 MR. LEWIS: Our comments to that are very
16 simple. If a person was to say we were going to go
17 hunting and we took a gun and went out into the area to
18 do our hunting and didn't know what we were hunting, it
19 would be very difficult to know what we would come back
20 with. If when we got out there and found that we were
21 hunting for birds and actually elephants approached,
22 we'd find out that we had the wrong ammunition.

23 The baseline information is that which is
24 found on Table 17 and is that which was found in
25 Appendix P and is that which is found in Table 20.

1 Further, Ted's argument, though sounding very good, has
2 two basic flaws. One is that the information submitted
3 by ARI -- the correct information that was submitted by
4 ARI -- was provided on March 27th. This report arrived
5 to us, or in fact, the very page that I am looking at,
6 is dated April 30th.

7 Now, the comment was there wasn't enough time
8 to go back through the tables and correct them. We
9 disagree with that; because, when you look at staff's
10 Figure 8 and 9, they did correct the numbers, according
11 to Appendix P and did not use Table 14 and 15, that Ted
12 Rauh referred to. So, in other words, they used
13 certain information on certain tables and other
14 information on other tables and incorrect information
15 on many tables. If there is a baseline that we are
16 looking at, then that needs to be cost effective. And
17 if that baseline is in error and flawed, then we
18 question cost effectiveness; because, cost
19 effectiveness hasn't been shown.

20 The sensitivity analyses that are referred to
21 have no data to substantiate their findings. In other
22 words, there isn't any way to go back and reconstruct
23 each and every sensitivity analysis that was made. We
24 believe that the right approach was to look at their
25 baseline data. And if that is suspect, surely, it

1 would be easy to conclude that at least the sensitivity
2 data would be suspect, when you look at the type of
3 work that was actually gone into the Staff Report.

4 MR. RAUH: I would just briefly refer the
5 Commission to Page 32 of the Staff Report, which
6 outlines the history of the acquisition of ARI data and
7 also indicates where it came in stream for the Report,
8 the fact that we did have to have some communications
9 with ARI about its data, and the differences between
10 its earlier submittal, and the fact that we, at that
11 point, indicated we would do a complete sensitivity
12 with the revised ARI submittal, which we have done.
13 And as I indicated on the tables I referenced earlier,
14 on that data alone, the proposed Committee action is
15 still cost effective.

16 MR. LEWIS: But, the statutory requirement is
17 that it's cost effective to the consumer. And, that
18 cost effective analysis must be shown. I mean, it must
19 be verifiable. And what we have attempted to do is go
20 back and verify the numbers that staff used. Why is it
21 that the staff would include, on Page 30a and 30b,
22 information that they knew was inaccurate when Appendix
23 P, dated 3/27, clearly is noted as corrected
24 information.

25

1 A letter went out from ARI because of the
2 problem that, I guess, in some transmittal of
3 information before everyone understood what was being
4 transmitted. ARI responsively went back and sent a
5 letter to the staff in plenty of time to be included in
6 an April 30 document to correct the inconsistencies.
7 I'd further mention, why was the figures...? Why do
8 the figures...? Why were they corrected -- Figures 8
9 and 9? And yet, Tables 17 and 20, which is the
10 baseline, they were not corrected? I don't think we
11 have a pick and choose issue here.

12 MR. RAUH: Well, I think that the inclusion
13 of the ARI original submittal provides an additional
14 fullness to the record. And at the time the staff
15 analysis was being done, staff felt that there was
16 validity in the original submittal that ARI had made,
17 the revised submittal. There were continuing
18 discussions about whether that was...the revisions and
19 why the revisions were made to their data. I don't see
20 any damage to the proceeding by including both sets of
21 data in the report, demonstrating an analysis on both
22 sets of data. As I pointed out, it has been the
23 interest of the Commission, in the past, to have a wide
24 number of sensitivities presented to you, using various
25 discount rates, various cost assumptions, and design

1 lifes. We have done this in this proceeding, in this
2 report, consistent with the kind of analysis we
3 presented in earlier standards proceedings to show you
4 the variations that are caused by changing some of
5 these parameters.

6 In this case, costs by the industry, alone,
7 which is not the staff's recommended set of baseline
8 numbers, we still recommend the set of numbers or a set
9 of numbers that has a weighted average on both
10 submittals of information. Basically, it still shows
11 that the standards are cost effective by a wide margin.
12 And I think that by reading the document, one can
13 clearly deduce what staff did all through this
14 proceeding in dealing with the issue of cost. I don't
15 find it confusing.

16 MR. LEWIS: I would ask that everyone look at
17 Page 36 and the title of Table 17. The numbers that
18 are reported there, each and every one of them, even
19 the errata sheet that was sent out in June to correct
20 this information, was still in error. The point is
21 that if there is an error here in the baseline
22 assumptions, there is no excuse to put out a document
23 that affects the consumer and manufacturers, such as
24 ourselves, to this degree, and there be inaccuracies in
25 it. And any conclusions arrived at by the staff and

1 Committee, based upon this document, and the baseline
2 study... Well, I just... I really feel like the issue
3 is presented very clearly.

4 The baseline is wrong, the numbers are wrong.
5 Table 17 is not just ARI data, as was just mentioned by
6 Ted. It is weighted information, including Carrier and
7 the ARI submitted information. It's weighted. It's
8 not just one manufacturer's information. It's not just
9 ARI's information. And those are the baseline numbers
10 that occur throughout this entire Staff Report, just as
11 we pointed out.

12 CHARIMAN IMBRECHT: What accounted for the
13 change in the ARI submittals?

14 MR. LEWIS: Well, I'm not ARI. But I can say
15 this. The information that we submitted to ARI around
16 the 1st of January, per the Commission's request, is
17 included in Appendix P. We don't know, not being ARI.
18 We do not know where Table 14 and 15 came from. But it
19 should be noted that even the incorrect -- Tables 14
20 and 15 -- a letter was written. It's docketed; and,
21 the correction was clearly made in a sufficient amount
22 of time for any changes that were necessary to be made,
23 to be picked up. Further, when the changes were made,
24 they only picked it up on some of the tables and
25 figures, not all of them. They selectively used the

1 correct numbers and selectively used the incorrect
2 numbers.

3 CHARIMAN IMBRECHT: I'm not sure I'm willing
4 to accept that allegation, at this point. Commissioner
5 Commons?

6 COMMISSIONER COMMONS: Dave, two questions.
7 First of all, you've identified the errors. Have you
8 made computations based on your best estimate of what
9 is your correct data as to what the appropriate numbers
10 ought to be?

11 MR. LEWIS: Well, because of the timeframe,
12 to be very honest, we were working into the wee hours
13 of the morning, even to conclude this document. We
14 have not had time to go back. And, you know, I'm not
15 sure that, really, it's our responsibility to go back
16 and correct each and every number. We just barely had
17 enough time to compile this information, based on the
18 time requirements that we have had to work under.

19 COMMISSIONER COMMONS: But, in case you had
20 done so, I was hoping we could have the benefit of that
21 work.

22 MR. LEWIS: The corrected, though,
23 information.... Now, we don't agree with Table 17,
24 even when its corrected, mind you.

25 COMMISSIONER COMMONS: I understand that.

1 MR. LEWIS: But that's aside from the issue.
2 Table 17 is is corrected for your review. Top of Page
3 5 is the information that is in the staff document with
4 the May 17th errata sheet, showing the 159 figure
5 change. And Page 6, at the bottom, are the corrected
6 numbers. Some of them, we believe, are quite
7 substantial. In fact, I'm sure you'd agree.

8 COMMISSIONER COMMONS: Let me ask this.
9 You've looked at what you are saying is are errors. Do
10 you think they would change positive numbers to
11 negative numbers? Or do they only go to the extent of
12 cost effectiveness? Do you have an opinion on that?

13 MR. LEWIS: Well, I think it would change it
14 dramatically. If you look at Item 4 on Page 6, the
15 only way, consistently, that you can arrive at the
16 Carrier number, when the number documented from
17 Appendix P is used correctly, would be the Carrier's
18 price would actually drop \$116.55, so that it would fit
19 within the weighted cost figure. I think it would
20 change it quite dramatically. I don't know of any
21 product that could change going from 8 to 10 and then
22 drop to \$116.55 because an efficiency increase was
23 incurred. That doesn't....

24 COMMISSIONER COMMONS: Let me ask you....

25 MR. LEWIS: Yes. The change is important.

1 MR. RAUH: Could I just bring one set of
2 numbers to yh our attention? If you look at Table 17,
3 where we indicate the weighted incremental cost would
4 be \$199 and you look at their estimate, using the ARI
5 data on Page 6, of \$207, we are talking about that
6 difference in the cost. We have already indicated a
7 large benefit stream. And therefore, it's still going
8 to be cost effective with their number. So....

9 MR. LEWIS: Why don't you compare the other
10 numbers in the table also?

11 COMMISSIONER COMMONS: The big difference is
12 on the single package.

13 MR. LEWIS: 159 to 195?

14 MR. RAUL: That's right.

15 MR. LEWIS: 471 compared to 520? 394
16 compared to \$463, including Carrier's number for that
17 upper standard, actually causing their equipment to
18 lower in price by \$116, from what's currently on the
19 marketplace.

20 COMMISSIONER COMMONS: Let me ask you another
21 broad question. I don't know if you want to answer it
22 or Ted. When you look at a heat pump, is there any
23 reason to believe that a heat pump from a cost
24 effectiveness standpoint on SER would not have at least
25

1 equal, if not greater benefits because of the heat side
2 as compared to a central air conditioner?

3 MR. LEWIS: Well, that's a completely
4 different issue. We do cover that in our report. We
5 can launch into that if we are through with this issue.
6 I'm happy to respond.

7 COMMISSIONER COMMONS: I don't want to jump
8 ahead. So, I'll hold that question.

9 MR. RAUH: I might just make one final
10 comment. Mr. Messenger has indicated to me that the
11 values for split system and single package shown on the
12 bottom of Page 6 of their testimony -- the 7,195, 520
13 and 463 were used by staff in its sensitivity analysis,
14 which are presented in the Staff Report. So, we have
15 looked at those runs and have determined that the
16 standards are cost effective.

17 MR. LEWIS: That really does not lay at the
18 heart of the issue. The point, as we see it, is that
19 the analysis that has been done, here in Table 17, four
20 out of four are incorrect.

21 CHARIMAN IMBRECHT: Question, though, I mean,
22 are they incorrect to a degree to render the final
23 judgment inaccurate? You tell us that....

24 MR. LEWIS: Chairman, definitely....

25

1 CHAIRMAN IMBRECHT: ...you are not in a
2 position to offer your perspective on that.

3 MR. LEWIS: Chairman, definitely, they would
4 cause a very dramatic effect. I think it would
5 completely mislead the outcome. Using these numbers
6 would mislead the outcome. The worst case example, and
7 it's easiest to use; because, it demonstrates the
8 issue. And that is when you have a product -- let's
9 say you have a product that moves a 2½ ton package
10 unit, that moves from 8 to 10 in efficiency due to new
11 design. And then in that move, the product price
12 decreases \$116. That's a dramatic effect and
13 dramatically incorrect. Not only based on the
14 testimony of this current heat pump ruling, but through
15 this last year and a half. I am sure Commissioner
16 Commons can mention that there has never been anything
17 reported from any manufacturer that prices would
18 decrease by going up in efficiency. It doesn't stand
19 to reason. So, the effect would be pronounced.
20 Basically, it would completely obliterate any kind of
21 price increase and actually would roll back numbers.
22 It doesn't hold.

23 MR. RAUH: On Page 43, the Revised Cost
24 Estimate Net Savings for Table 26 which is utilizing
25 the numbers that are presented, we show the net savings

1 benefit being \$156 and \$133. So that is the specific
2 table in which we utilized the ARI cost data.

3 MR. LEWIS: Where did those numbers appear
4 anywhere else in this document? Derivation-wise. They
5 don't appear. There isn't even.... In fact, from
6 Page....

7 MR. RAUH: They are derived with the
8 methodology that is described in the Report and the ARI
9 cost. That's the only change....

10 MR. LEWIS: The methodology is not described
11 in the Report. That's part of our argument.

12 MR. RAUH: Well, we just have a disagreement
13 there in terms of the material preceding this that
14 describes how we came up with cost numbers, how we did
15 the evaluation and so forth.

16 MR. LEWIS: Point it out. It's not there,
17 Ted.

18 COMMISSIONER COMMONS: Mr. Chairman?

19 CHAIRMAN IMBRECHT: Commissioner Common.

20 COMMISSIONER COMMONS: Let me just make sure
21 I'm following the same line of questioning that you
22 are. My understanding.... Assuming their numbers
23 would be correct, that you would have to make the
24 following adjustments on that table, as you would
25 adjust downwardly the split system by 8 and \$49 and the

1 package systems by 36 and 68. I want to see if that's
2 correct. What I'm trying to do is go back and see if
3 we can answer the question....

4 CHAIRMAN IMBRECHT: Fundamental question.
5 Right.

6 COMMISSIONER COMMONS: Does it affect the
7 outcome? Or does it affect the.... Is it more
8 affected by \$400 or \$200? Using the numbers that you
9 were just giving, the numbers I come up with on the
10 split system should be reduced by 8 and \$49. And on
11 the package....

12 MR. LEWIS: Do you mean increased?

13 COMMISSIONER COMMONS: Yeah. The cost should
14 be increased on the 8 to 9 SEER for the split by \$8, on
15 the 8 to 10 by \$49, and on the package by \$36 and by
16 \$68.

17 MR. LEWIS: It should be pointed out that the
18 \$463 value.... Okay.

19 COMMISSIONER COMMONS: The second error that
20 was identified, which staff.... Recognize what I'm
21 saying that this is an error, I guess I should probably
22 use the statement alleged error, was on the SMUD
23 heating, which we calculated was roughly equivalent to
24 20% of the net benefits on the heating. And then there
25 is an issue that's been raised as to whether or not

1 there has been the appropriate allocation from
2 Pasadena, from Sacramento and from each of the areas as
3 to the incidents of heat pumps. But, everyone agree
4 that we have no better data than that which we have.
5 It just doesn't seem....

6 MR. LEWIS: No, we didn't agree to that.

7 COMMISSIONER COMMONS: It doesn't correspond
8 with your own belief; but, we have no other data that
9 we can present to make an assessment. I'm just trying
10 to see.... I'm trying to add up the different things;
11 because, you might have one thing at 20 and another at
12 40. You add them all up and it might change the
13 outcome; so I am trying to put them all together
14 into....

15 CHAIRMAN IMBRECHT: I understand that. I
16 appreciate that.

17 MR. RAUH: While they are discussing, perhaps
18 I can bring one more fact to bear on the Sacramento
19 data point that is being contended here, actually
20 several points.

21 First of all, we derived those values by
22 using the state-of-the-art computer program that takes
23 into account climate conditions, weather tape, etc.
24 -- the same computer program we establish building
25 standards with. Then we modeled a particular home, a

1 particular home size in each of the 15 regions. We
2 came up with those numbers, the numbers that are being
3 compared to ASHRAE degree days. ASHRAE degree day
4 method is a much less sophisticated method that is not
5 used in establishing performance based standards in
6 California. We have moved, over the last seven years,
7 to computer modeling, computer simulation, and as the
8 Commission is quite aware, we have our own public
9 domain computer programs that have gone through
10 extensive building industry scrutiny, where there are
11 accuracy and predictability of actual conditions.

12 MR. GILLES: Mr. Chairman, we....

13 MR. RAUL: Let me finish, please; because,
14 that's not the only point I wanted to make.

15 MR. GILLES: Alright.

16 MR. RAUH: Secondly, SMUD documented an
17 actual metered study of heat pump energy use in
18 Sacramento. That study came out in excess of the
19 number that our computer model predicted, by well over
20 200 kWh per yer for heating. That's an actual meter
21 data study that corroborates the general finding or the
22 modeling finding of our computer analysis. So,
23 basically, we think those are important facts to bring
24 forward about the relevant accuracy of degree day

25

1 method versus computer simulation and the actual meter
2 data study that verifies that number in Sacramento.

3 MR. GILLES: I couldn't agree more, Mr.
4 Chairman. We cross-checked it also. We used Air Force
5 30-year baseline data on temperature frequencies for
6 both Fresno and Sacramento to make sure that we were on
7 relatively solid ground in the time we had available.
8 We did not use DOE 2.1(b) because of the time involved
9 and the time we had to work on it. But, an examination
10 of the Air Force 30-year temperature frequencies for
11 Fresno and Sacramento will show the verification of the
12 degree days that are a standard part of ASHRAE and had
13 been there for years in the guide. And we did do a bin
14 check on the heating loads; and, they are just totally
15 wrong. On Table V-8, for the 1400 sq. ft. houses, you
16 are using \$28,441,000 for Sacramento; and you are using
17 \$17,618,000 for the same house in Fresno. It just
18 doesn't make sense.

19 MR. LEWIS: I think we can make a further
20 comment. I don't mean to boast; but, I believe Lennox
21 also has state-of-the-art computers. And I think our
22 people are also competent in operating them. I don't
23 think that is even an issue. What's really at issue
24 here is: What information was used? The information
25 that was used was inaccurate. I guess the best way to

1 show its accuracy, I don't know the best way, but a way
2 of showing the inaccuracies, we are not merely arguing.
3 And I know we have diverted back now to our original
4 discussion in Appendix I. Our whole premise is that
5 the heating information is suspect as we believe the
6 cooling information is suspect. But, that number is
7 multiplied by another number. That number is also
8 suspect. Those numbers also end up being used, not in
9 just one case showing an example, but is the very part
10 and parcel or the very framework of the staff document.
11 Table 20, Table 17, Appendix I, Appendix J, going
12 through the entire book, the point is they have shown
13 cost effectiveness on a baseline case. And there are
14 errors, whether we call them alleged or not, there
15 isn't any way to be able to duplicate them.

16 CHARIMAN IMBRECHT: The question is: Are
17 they errors of such magnitude as to change the ultimate
18 conclusions? I'll just say to you in response -- and I
19 think that most people in this room know my attitude
20 about these overall subjects -- but I have to say, as
21 well, that (and I've never hesitated in expressing
22 this) I don't frankly that the industries demonstrated
23 any particular superb track record in terms of
24 submission of information and data, etc., analysis as
25 well that contrasts in any dramatic fashion with that

1 which is being held up against staff here at the Energy
2 Commission. That's not the statement that, frankly, is
3 one that I want to have debated. That's my own
4 personal judgment.

5 And I might say, as well, that as has been
6 the case in many of these discussions, I think we have
7 seen an increased degree of cooperation. But, there
8 also has obviously been a fair degree of reticence,
9 sometimes justified, but in some cases, clearly with an
10 overriding or a phrase used this morning -- "tactical
11 consideration, as well, in terms of submitting
12 information to the Commission.

13 What I want to get to, and this debate's gone
14 on long enough as far as I'm concerned, in terms of
15 back and forth on tables. I don't find that weighted
16 incremental costs that you show in your document versus
17 that which is in the staff document, the differences
18 that to be of such magnitude that they jump out at me
19 as suggesting that the ultimate conclusion is going to
20 be in error. So, what I want to find out is, in
21 essence, what Commissioner Commons was asking, as well.
22 These differences of \$40 or \$50 are not dramatic. And
23 unless you can demonstrate.... I want to see some
24 demonstration of how that's going to translate over
25 into reversing, in essence, the fundamental conclusion

1 that at least a first tier, which is the one that I am
2 personally focused on, as I have also frequently
3 expressed by viewpoint about setting tiers out in the
4 future, that they are not, in fact, cost effective.

5 MR. GILLES: Mr. Chairman, since I did most
6 of our economic assessment, I'll pinch hit here for
7 Dave for this time at bat. What.... The key issue
8 that we hold with eminence here is the fact that there
9 are identified, we think, errors on both sides of the
10 critical life cycle cost effectiveness equation. We're
11 seeing what you're asking and Commissioner Commons is
12 asking, that there is identifiable, apparent true
13 variation on one side in terms of the differential
14 first costs. What we are saying on the other side of
15 the equation, as shown in the results in Table 20,
16 related to the energy savings, is also in error; and,
17 we honestly don't know the magnitude of that error.
18 So, we can't say, out of hand, that yeah, there's not
19 much error over here, so it's still going to wash okay
20 over here. Because there is an error on the other side
21 of the equation. There are errors, we believe, on both
22 sides of that critical equation.

23 COMMISSIONER COMMONS: I don't understand
24 -- excuse me for interrupting, Mr. Chairman -- the air
25 on the cooling side. I have not, yet, understood.

1 MR. LEWIS: The two sides are first cost
2 offsetting savings. That's the equation and that's
3 what's required in the statute. For cost effectiveness
4 to the consumer, the savings needs to offset first
5 costs.

6 COMMISSIONER COMMONS: But the only errors
7 I've heard are the heating error where we have a
8 specific number and the cost error where we have
9 specific numbers.

10 MR. LEWIS: ...and, the factor that the
11 cooling data is multiplied by creating a cooling error
12 and their cost numbers, which would be the same.

13 COMMISSIONER COMMONS: We don't know the
14 direction.... If there were an error, we don't know
15 othe direction of that error. If that would increase
16 or decrease and you have no evidence to present to us,
17 other than your opinion, as to whether or not that is
18 correct. I don't know what evidence we have better to
19 rely than the evidence that's been submitted on staff
20 on this. It may increase or decrease it; I don't know.

21 MR. LEWIS: That's a true observation. The
22 only thing is that we know, also, that the information
23 presented there, in that table, is also inaccurate.
24 So, we can't base it on some inaccurate data either.

25

1 COMMISSIONER COMMONS: Alright, let me give
2 you the sum of the two numbers, because I have
3 calculated that -- first for the 8 to 9 standard or the
4 first step. For the split system, the sum would be \$35-
5 -that's \$8 on the cost side plus \$27 on the heating
6 side. And that's just assuming the alleged error on
7 the SMUD and making that adjustment. On the single
8 package, it would be a total of \$88, including \$52 on
9 the heating. And on the second step, \$30...a total of
10 \$82 on the split system, which would include \$33 on the
11 heating and \$130 on the single package, which would
12 include \$62 on the heating. Those would be the sums of
13 the two numbers that we've heard. Now, how that
14 compares to the benefits, I would assume the staff has
15 that. So, in short summary, on the first tier a single
16 split system would be \$35 and a single package \$88.

17 MR. LEWIS: I guess there are two points,
18 then, that we would comment on. First of all, since
19 there are various sensitivity studies, it seems like
20 what happens is if one becomes faulty, there's a
21 reliance on another. All information that proves or
22 builds the case of cost effectiveness must be
23 available. And up to this point, all the information
24 on all the various sensitivity analysis have not been
25 provided; so, it is impossible for us to make a good

1 solid statement that we could really rely on as far as
2 the effectiveness of the other items.

3 COMMISSIONER COMMONS: What I'm trying to do,
4 Dave, is find out if I have to go the merits of whether
5 or not there was an error or to say the error does or
6 does not affect the final judgment. If the error turns
7 out not to be so substantial that it would affect the
8 outcome, whether or not it's an error not, I'm not
9 going to formulate an opinion.

10 MR. LEWIS: But the point is that the NOPA is
11 based upon the findings of the staff contained in the
12 Staff Report and Committee Report. Outside....

13 COMMISSIONER COMMONS: The judgment of the
14 Commission today is going to be based on the
15 information that's presented in the Committee Report
16 and the evidence that we hear today. I'm not asking
17 these questions because I was a member of the Committee.
18 I am asking these questions because I am interested;
19 and, I want to make sure that the judgment that I am
20 eventually asked to make is proper. So, I'm listening
21 to the testimony.

22 MR. LEWIS: Well then, could all the
23 sensitivity data, then, be provided? I guess that
24 would be our request.

25

1 MR. GILLES: Well, first of all, the baseline
2 data's got to be correct.

3 MR. LEWIS: Well, he's....

4 COMMISSIONER COMMONS: I'm mainly concerned
5 with the baseline data. I can make a judgment on the
6 sensitivity cases; but, I want to make sure I have an
7 understanding of that baseline data.

8 MR. LEWIS: Well, if the baseline data is
9 inaccurate and we don't have any way to conclude one
10 side of the equation, that being the amount of weighted
11 use that is averaged for the State, then even if the
12 incremental price increases were correct, still you
13 don't have justifiable grounds on which to raise the
14 standards.

15 COMMISSIONER COMMONS: Maybe there are other
16 parties, Dave, and yourself who can give us better
17 information. But, I'm sure the staff has asked for
18 information on this; and, this is the best evidence
19 that they have available to give to us. I've heard no
20 information to say something should be something other
21 than what it is, except questions being raised as to
22 the appropriateness. For all I know, it might be
23 higher or it might be lower.

24 MR. LEWIS: The reason why we argue with the
25 direction that this is taking is....

1 COMMISSIONER COMMONS: Actually, I think the
2 SMUD number here on the waiting seems a little low
3 compared to my own thoughts in terms of heat pump
4 allocation.

5 MR. LEWIS: We believe the...specifically,
6 your shipment information and the way that's weighted
7 throughout the State of California, to arrive at an
8 average. I don't think that the statute would
9 allow.... Let me take it from another direction. I
10 believe that you have to look at the populus within the
11 State of California. Anybody within the State of
12 California can purchase a heat pump. I think it needs
13 to be weighted the fairest way for it to be weighted is
14 by population. And if were weighted by population
15 (which there is good information, solid census
16 information on that), I think that would be the most
17 logical way to proceed to show that there's cost
18 effectiveness on average to the consumer within the
19 State of California that may purchase a heat pump
20 system.

21 COMMISSIONER COMONS: Well, I wouldn't accept
22 that; because, that might make a bias for or against
23 the standard because people buy heat pumps based on the
24 gas versus electric rate. And so, you may be
25 justifying a standard because of the population density

1 in areas where people don't even buy heat pumps because
2 it's not in their interest to do so. You've got to get
3 into the economics of the utilities.

4 MR. LEWIS: Commissioner, you've made the
5 point that we haven't come up with anything. We
6 believe that we have just provided a suggestion.

7 COMMISSIONER COMMONS: Okay.

8 MR. LEWIS: And the suggestion is that since
9 the consumer that's spoken of in 25402(c) is a
10 California citizen living, dwelling anywhere within the
11 state, that the cost effectiveness on average, should
12 be to any person wherever they reside. It shouldn't be
13 biased by where they live. That's a suggestion.

14 CHARIMAN IMBRECHT: Is that your conclusion
15 that we have to find cost effectiveness for every
16 citizen in California? Is that what you are saying?

17 MR. LEWIS: I'm saying that, on average, a
18 citizen living within the State of California. The
19 average citizen in the State of California that
20 purchases a heat pump, it should be the standard that
21 is regulating that industry--should produce a heat pump
22 that's cost effective for that average California
23 citizen.

24 CHARIMAN IMBRECHT: For that 'average'
25 California citizen?

1 MR. LEWIS: No matter where they reside.

2 COMMISSIONER COMMONS: In other words,
3 Sacramento would have 128, having roughly 128th of the
4 population. You'd weigh it 128 rather than 28%. Then,
5 you would take Los Angeles and you'd weigh the county
6 at 25% rather than what shows up here at 8 or 10
7 percent. This weights it more in terms of the staff's
8 best estimate as where heat pumps are sold. They are
9 suggesting--as a cross-check, it's certainly not a bad
10 idea.

11 MR. LEWIS: I guess one further issue that
12 somehow has alluded us and that is two standards are
13 being set here. The cost effectiveness only is really
14 shown for one standard. The second standard has never
15 been addressed. And that is, the cost effectiveness
16 that needs to be shown for a person buying that product
17 where the product available is already at that first
18 standard level. Then, the cost effectiveness should be
19 based upon, from that new level, to the second level.
20 Instead, the way it's been going is the analysis has
21 been done from 8 to 9 and then 8 to 10. It should be
22 done from 8 to 9 and 9 to 10, or 8 to 8.9 and 8.9 to
23 9.9, specifically.

24 COMMISSIONER COMMONS: I have one other
25 technical question on the cost, since we are talking

1 about errors. Bill, was the costing done on the
2 original NOPA or on the Committee recommendation, on
3 the HSPF?

4 MR. PENNINGTON: It was done on the original
5 NOPA.

6 COMMISSIONER COMMONS: If we dropped and we
7 weren't to adopt the original NOPA, and were to adopt
8 the Committee's recommendation on the HSPF, that would
9 tend to reduce the cost of implementing this.

10 MR. PENNINGTON: One would suspect that.
11 Yes.

12 COMMISSIONER COMMONS: It might vary from
13 manufacturer to another. I believe that's what Carrier
14 testified, Bill.

15 MR. PENNINGTON: That could be.

16 MR. GILLES: Mr. Chairman, there has been a
17 lot of rhetoric here in the last few minutes.

18 CHARIMAN IMBRECHT: Yeah. There certainly
19 has.

20 MR. GILLES: I repeat that Table 20 is
21 critical to this whole procedure and in our best
22 conscious, feel there are unidentified errors on both
23 sides of that critical equation. There are errors on
24 the present value of the savings from one source or
25 another. There are errors on the first cost

1 differential. And it is difficult for me, personally
2 as a professional engineer, to see how the Commission
3 can proceed to adopt anything based on a baseline
4 situation that is known to have errors in all the
5 critical elements.

6 CHARIMAN IMBRECHT: Okay.

7 COMMISSIONER COMMONS: I have one other
8 comment. I'm sorry. The suggestion that they make on
9 a population basis might have methodological problems
10 because of the climate zones. The climate zones cross
11 counties; and, it's not as simple a calculation as we
12 might suspect originally.

13 CHARIMAN IMBRECHT: Okay, why don't you
14 complete your presentation? I think we need to move it
15 along here.

16 MR. LEWIS: On Page 7, the section regarding
17 Equipment Turnovers. I extracted two quotes from the
18 Staff's Report found on Page 22 and 43, both of which
19 report that there is a roughly 10% normal turnover per
20 year. Page 43 actually proceeds to say that "...the
21 manufacturers anticipated progress in approving the
22 efficiency of these models. Each year, the
23 manufacturers remove 5 to 15% of their least efficient
24 models."

25

1 I would like to also note that in the June
2 19th document that we just found last evening, that
3 they respond within it to our comment. Their response
4 is this -- we brought this issue up in the May meeting
5 but the response is this "The Staff Report did not
6 indicate that 15% of Lennox' models would be
7 eliminated." The exact quote in the Report refers to
8 "All manufacturers (on the average) would be required
9 to design or retool 15% of their models, each year, to
10 meet the 89 standard." Of course, obviously, the '89
11 standard is a typographical error. But nowhere in Page
12 22 does it speak of manufacturers on the average. But
13 they go on to say that what is important is not the
14 current fraction of (Lennox Models). Then it goes on.

15 I just seriously question the whole reasoning
16 that lies at the foot of this issue. We're saying that
17 the 10% retooling rate is inaccurate, and that
18 currently if that 8.9 standard went into effect, nearly
19 90% of the models now available in the State of
20 California would not be available after that standard
21 goes into effect. That is a tremendous impact on a
22 manufacturer. That would be like if the Chrysler
23 Company had 90% of its models absolutely removed from
24 saleability and had to redesign all of their cars. You
25 know, such a level of change is very pronounced and

1 there is no justifiable basis. Some of our products
2 have been in our line for 25 years. Others may last 10
3 years. It all depends on the economic cost
4 effectiveness of the product in the marketplace for the
5 consumer.

6 We would just mention that we have the
7 responsibility of warehousing replacement parts for all
8 of the products that we sell, not only for the time
9 that it sold, but also for a long period of time
10 afterward. If we had to retool and change our complete
11 product line each year as the staff reports somewhere
12 between 5 and 15%, the amount of inventory warehousing
13 needed for the inventory of replacement parts alone
14 would break mid to small manufacturer's back. We
15 couldn't financially afford such a situation.

16 There is also such things as the cost of
17 development, the required agency approval on equipment,
18 the manufacturer's tooling, the phase in and phase out
19 of new products, the nightmare that it would represent
20 in distribution channels, product changes, advertising,
21 the dissemination of product line changes to service
22 technicians and associated training. All those are
23 responsibilities of the manufacturer. If we changed
24 our product line 15% a year, we couldn't even keep up
25

1 with the changes. The whole idea is really very
2 absurd.

3 And I think the thing that really needs to be
4 noted is that on Page 44, the clear point there is that
5 90% of the product available (it's that last section)
6 "...standards set at 9.0 will change from 90%...."
7 Now, that means that without any other consideration,
8 right now, what's available on the marketplace, you're
9 requesting 90% of our product or the parts available,
10 to be altered, retooled, redesigned. I think it has
11 tremendous impact on a manufacturer.

12 Next, we very much find problems with trend
13 line analysis that's been employed by the staff. We
14 just would point out in the Warren-Alquist Act the word
15 'feasible.' And the word feasible there clearly has to
16 do with what is available to the consumer. Okay, let's
17 just take a little road here and examine that. They
18 are saying that levels up to 13% SEER are feasible and
19 attainable. Well, first of all, 13.0 SEER heat pump
20 equipment currently does not exist. We would not say
21 that they will never exist; but, they are not
22 available.

23 The point is that they have taken a lot of
24 information and drawn a line through it and said if
25 this continues, this will happen. But, later on in the

1 report, we we talk about the amount of change that has
2 gone into compressors, themselves. And you will find
3 that it isn't a straight level line; but, it's a curve
4 and it has much to do with cost effectiveness to the
5 consumer. A consumer buys a more efficient product
6 because he or she can get a rate of return or payback
7 for the extra amount that they pay out for the
8 efficiency that they are going to save. But, if that
9 efficiency or utility bill--annual utility bill--if
10 there are not savings on that to them, there isn't any
11 reason for a consumer to go to a higher efficient
12 product. That's the way the pre-market system works.

13 We believe that the word feasible, as Webster
14 defines it, should be within reason. And we just feel
15 like the trend line analysis that's been conducted is
16 not within reason. On Page 13 of the staff document,
17 it goes on to say that in early 1990, there will be
18 equipment available, 13. SEER. How and by what basis?

19 CHARIMAN IMBRECHT: I'm going to ask you to
20 move on. I don't see how that's relevant, frankly,
21 since nobody's recommending a 13 in this proceeding.

22 MR. LEWIS: Well, I guess the point is that
23 trend line analysis has been used throughout. I'll
24 move right on.

25

1 The next item will be the single package heat
2 pump systems and on the single package heat pump
3 systems, there is the most pronounced effect. The
4 reason why there is such an effect is because the
5 second standard currently in place have no product
6 offerings available. There aren't any product
7 offerings available today for the second standard. For
8 the first standard, it would affect very dramatically
9 the product line. And if you can turn back to B,
10 starting with B3, these are charts that we have used
11 before; but, I believe they are still pertinent.

12 B3 shows the effect of going from a 7.5 to an
13 8 SEER, which would effect 43.71 percent. Going from a
14 7.5 to 8.5, as pictured on B4, it shows that 90.9% of
15 the existing product would be removed; and, that's for
16 a split system. Single package is on the next sheet,
17 B5 shows 7.5 to 8. And then on B6, we showed the
18 effect on single package which is 94.27 percent of the
19 existing product of the California marketplace being
20 removed. We think that definitely needs to be
21 considered. The effect on a package system is much
22 more pronounced.

23 Also, in the staff document, the items
24 reviewed are: How many models are currently available?
25 And we discussed this before; so, I will be very brief.

1 It doesn't really matter how many models are available.
2 It matters very much as to whether a family is
3 available. If a manufacturer's product's at 2 to 2.5,
4 3 to 3.5, 4 to 5, which is typical, in order for them
5 to be able to be in the marketplace and providing
6 equipment to the customers, the contractors, the small
7 businessmen that they look to, in order for them to be
8 in the marketplace, they need a full family product
9 offering. You couldn't have.... A contractor would
10 not install many different types of equipment on a
11 residential housing development. He has to go back and
12 warranty his parts and labor and have his men go out
13 and keep everything going and people satisfied. It
14 would be very expensive for him to have different
15 manufactured products installed in a given housing
16 tract. And that would be what would happen if models
17 are continued to look at. We are saying that the
18 analysis done is only partially accurate in that the
19 whole picture is not reviewed.

20 We'll skip down to Page 15 where we mention
21 about crankcase heaters. There was an exhaustive
22 workshop on crank case heaters. There were a lot of
23 question as to whether it was really significant energy
24 use saved. Let me try that again. There was a big
25 question about whether there was significant energy

1 saved on a statewide basis which the 25402(c) refers to
2 by considering the crank case heaters.

3 That was never documented; however, we have
4 put within this report that Lennox equipment has an
5 average demand of approximately 23 watts of energy. We
6 believe that this is a rather insignificant portion of
7 the whole picture. Should be reviewed but shouldn't be
8 overly weighted on the crank case heater issue.

9 Next, high efficiency heat pumps in the
10 marketplace. Pages 20 and 21 of the Staff Report
11 allude to a mistaken concept that there are more high
12 efficiency heat pump systems available than are
13 available in air conditioning products. We would ask
14 that attention be paid to the accompanying drafts in
15 this Report, Appendix B, which clearly shows that the
16 effect of heat pumps is much more pronounced. Another
17 error that we believe is very definable.

18 Then there were a number of procedural
19 irregularities. The pricing information we believe
20 that was requested, does not fulfill the requirement of
21 the California Energy Commission, in their review of
22 cost effectiveness to the consumer. We merely make the
23 point again that it has, not to do with what a
24 manufacturer says his product is. It has much to do
25 with what the consumer pays for the product. Polaroid

1 might advertise a camera to be sold at \$99. In
2 reality, that product may not be available. And
3 because of a shortage of supply, some people would
4 charge much more for that. I know my daughter recently
5 got a Cabbage Patch Doll. And I certainly paid more
6 for that Cabbage Patch Doll than Calico expected.

7 My point is simple and that is that pricing
8 information is important. It's part of the whole cost
9 effectiveness analysis. And unless it's done from a
10 consumer standpoint, the information that was requested
11 and the information that the staff has based their cost
12 effectiveness analysis upon, is not complete.

13 The next item is Three Phase Equipment. The
14 Three Phase Equipment Report came out after the NOPA
15 went out. We feel that this is quite an irregularity.
16 It's very hard for us to try to respond to three phase
17 power. And we believe that the items addressed in the
18 Three Phase Staff Report leave a lot of questions
19 unanswered. The whole three phase issue is very
20 complex, when you consider the amount of items that
21 affect three phase units use.

22 The amount of hours used, the type of use of
23 a commercial system experiences, which a three phase
24 system is, is significantly different from a
25 residential system. A three phase condensing unit or

1 outdoor heat pump unit experiences more level operating
2 use, while the costs are very likely to be similar to
3 the single phase residential unit counterpart, the
4 usage patterns, the maintenance patterns which must be
5 part of the cost effectiveness analysis, are greatly
6 varied. We can't find that the staff made any kind of
7 a review on three phase systems, but instead relied on
8 suspect document of this report that came out in May.
9 In other words, the three phase issue relies on the
10 cost effectiveness that we believe is in error in the
11 May staff document.

12 Then there are a series of questions
13 regarding the 15-day language changes. Actually, we
14 are not opposed to the items which are recommended for
15 change. As far as the change being lower, we believe
16 that that would actually result in a more cost
17 effective heat pump factor. We don't agree, though....
18 We don't believe that they went low enough; because, we
19 don't think the cost effectiveness analysis has been
20 done to base on the lower numbers. Be that as it may,
21 at the bottom of Page 18, after we have received two
22 changes, then some days later another proposed
23 modification to the NOPA was sent out changing the
24 lower level recommendation or the first standard of the
25 heating seasonal performance factor to go into effect

1 January 1, to be altered from 6.6 to 6.4. The copy of
2 which I have attached (and I have attached it to
3 Appendix C) was mailed from the California Energy
4 Commission and postmarked June 17th. It was received
5 at our office on June 19, as noted.

6 Now, we have no direct argument with a level
7 decrease and actually believe that even those levels
8 -- 6.4 in '88 and 68 in '93 -- for those two standards
9 are still above the level which are cost effective. It
10 should be noted, however, that a statutory requirement
11 for 15-day language was not met.

12 We did have a problem with the June 20 letter
13 that came out, which was an errata on the 15-day
14 language that was sent out that we received June 19.
15 And this is the portion where we have some very
16 specific problems with; and I'll quote: "The
17 Commission mailed a copy of the proposed modification,
18 together with a notice that identified the possibility
19 of such a change to interested members of the public.
20 Although the Commission was not legally required to
21 make a notice or the proposed change to the public."
22 This statement takes a fling at trying to pass normal
23 dissemination of information serving notice of the
24 Commission's intent to possibly withhold pertinent
25

1 information which completely stands counter to due
2 process.

3 We do believe that the Commission has a
4 responsibility to send out the information. We do
5 appreciate information being sent out; but we think
6 it's a requirement. And this is kind of an off-handed
7 remark that may be later used. We want to go on record
8 that we think information must be sent out, especially
9 to the interested parties.

10 Then Point E is that there were two
11 standards. We already made this point. There is a
12 cost effectiveness analysis (flawed as it is) done on
13 the first standard. Nothing has really been done on
14 the second standard.

15 Then, we go into an area of the basis of cost
16 effective analysis. I'm going to be very brief on this
17 section. a) The discount rate that we believe is
18 unjustified and should not be used in government
19 discount rates. b) Increased costs we believe is
20 inaccurate. We thinking the waiting is inaccurate and
21 we think field data must be gathered. c) The typical
22 weather data: The weather data used by the California
23 Energy Commission's state-of-the-art computer was
24 inaccurate in the air conditining standard. We are
25 still suspect of it and do not believe that the errors

1 have been changed. Nothing has been shown that the
2 errors were changed from the air conditioning standard
3 rulemaking. We really don't have any way of knowing
4 what's happening in this rulemaking. d) The heat pump
5 size: We definitely believe that 2½ ton system is the
6 correct size. It would be good to have a little more
7 review of field data, but we do concur with that.

8 Design life, of course, this is a whole
9 matter which is very frustrating to manufacturers and
10 the Energy Commission, both. But we would point out
11 that considering design life, there are a number of
12 items that actually affect what a design life is. How
13 a system is used, what temperature the home is set at,
14 what kind of comfort level is desired to be maintained,
15 whether or not the homeowner uses the night setback
16 thermostat, as it is intended to be used, whether the
17 system, itself, is oversized for the dwelling or
18 undersized, the amount of cycles that a system is put
19 through in a given heat-ing and cooling season, how
20 clean and dust free the nearby surroundings are to the
21 outdoor section of the air conditioning and heat pump
22 system. These are all major areas. And I think they
23 need to be considered. Plus, I think, in the design
24 life area, the whole maintenance factor needs to be
25 reviewed, which I have found nothing whatsoever even

1 mentioned within the Staff Report.

2 Going on, pertinent information not
3 considered in staff and committee recommendations, here
4 I'll just take a few minutes. I think these are some
5 important items. We believe, in the Report, that there
6 is increased maintenance on a higher efficient product.
7 And we also believe another factor that needs to be
8 reckoned with is efficiency degradation. These two
9 items kind of work together. And, we will try to paint
10 the picture successfully to show exactly what effect
11 the maintenance and degradation it officially has on
12 the overall cost effective analysis.

13 We have provided, in Appendix E, a paper
14 presented at Purdue University, touching this issue by
15 a noted engineer. He goes on explaining why more
16 efficient product--that there's a real liability factor
17 involved. More current, though, is a study by an out-
18 of-state utility. They went out and they have been
19 paying rebates on higher efficient products. And we
20 mentioned this, in brief, in our May issue...in our Ma
21 (seems like they are being published regularly now)
22 -- the May document. And that is that of those units
23 that rebates were paid out by the utility on, 23% of
24 them those rebate units, were short on Freon. The
25 effect of this is that those units had a 52% increase

1 in operating costs. We make the point that this was
2 very difficult for the utility, but needs to be
3 considered equally by a standard setting body, such as
4 yourself.

5 The same study also reviewed the operational
6 characteristics of a high efficiency unit and found
7 that the units were operating for a longer period of
8 time, thereby providing less diversity for the utility.
9 And this finding runs counter to the Staff Report's
10 claimed benefit reducing demands for peak through
11 regulated minimum efficiencies. Of the units reviewed
12 that have the correct Freon charge, and this is, I
13 think, maybe the most important item, the amount of
14 build-up on the outdoor coil from debris such as animal
15 fur, dust and dirt, lint from clothes dryers, leaves,
16 cottonwood fibers and miscellaneous build-up from
17 various environmental factors were shocking. When
18 items such as this get caught in an outdoor condensing
19 coil, it cannot properly perform, which lowers the
20 overall equipment efficiency in a very significant
21 matter.

22 Now, we go through a little explanation of
23 what happens when a condensing coil gets clogged up
24 from debris such as this. The heart of the issue is
25 that part of what's happened by manufacturers to get

1 higher efficient products is to design the outdoor coil
2 so that there's more heat transfer surface area. The
3 more heat transfer surface area, when considered with
4 other component changes, increases the efficiency of
5 products. The old designs used to be 10 to 12 fins per
6 inch. But now 24 fins per inch are often found on
7 outdoor transfer heat transfer coils. With the
8 addition of more fins per inch, the condensor coil,
9 which moves air across the outdoor heat transfer coil,
10 must be sized so as to overcome static pressure of that
11 coil. Serious attention must be given to the sizing of
12 the condensor fan so as not to draw more amps than are
13 necessary, and yet, be sized sufficiency large enough
14 so as to overcome the restriction of the more fins per
15 inch.

16 When there is buld-up on the outdoor coil, as
17 mentioned previously, that adds to the static pressure
18 of the coil which the condensor fan must overcome. If
19 the coil becomes clogged, the air cannot move across
20 the coil. When this occurs, the coil does not relieve
21 the amount of heat that is necessary to keep the system
22 operating in ints most efficient perimeters. The key
23 to this is in the field analysis, the second paragraph
24 on Page 27, some of the coils in this clogged condition
25 are actually operating at levels of 4.4 EER.

1 Now, what has to happen is one of two things.
2 Either a person pays more maintenance on a high
3 efficiency product to keep the product operating within
4 its intended design parameters. Or, a person
5 experiences a greater degradation factor of the
6 efficiency with that product not receiving the
7 maintenance factor that would be the other option. In
8 other words, you pay for it one way or the other.
9 Maintenance has not been an item factored into cost
10 effectiveness. It is an item that affects the consumer
11 or the purchaser of the product. And we, again, put in
12 some information and further went on.

13 Compressor Efficiency: Prior to the Arab oil
14 embargo in 1974, an average compressor motor operated
15 at an 8 compressor rating point--ARI test report. The
16 8 compressor rating point level was typical for all
17 compressors in operation, in and around the 1972-73
18 framework. In approximately 1975, motivated by
19 consumer demand and cost effectiveness, the major
20 compressor manufacturer looked towards improving the
21 efficiency of the compressor by using a high efficiency
22 motor. This brought about an immediate positive effect
23 on compressor efficiency. The changes employed in
24 increasing motor efficiency had been known for some
25

1 time. But, up to that point, were unmarketable due to
2 it not being cost effective.

3 Improvement also came compressor valving, the
4 way a compressor motor was cooled, the removing of
5 restrictive items such as noise restricting mufflers
6 which directly affect the discharge pressure drop of a
7 compressor. What remains in further efficiency gains
8 mainly center arounds compressor motor efficiency. It
9 has taken another ten years for the bulk of compressor
10 technology to move up to the 10 CRP level.

11 In summary, it took two to three years to
12 move from 8 to 9, but then it took ten years to move
13 from 9 to 10 CRP. The last move was slower in coming,
14 mainly due to the extreme difficulty of moving to
15 higher efficiency within the given restraints of
16 technology.

17 We then go into a little point as far as what
18 does one percent of a CRP increase actually...what is
19 it actually worth. Then we go into a point where we're
20 showing what kind of efficiency is currently available,
21 the current compressors are at about the 87% level, a
22 92% motor would provide 5% more compressor efficiency
23 and would cost approximately 50% more. A 5% increase
24 in the efficiency of the compressor motor can cause the
25 compressor cost to go increase between 50 and 60%.

1 The total system increase, then, is greatly
2 dependent upon the transfer core. Considering these
3 facts from another angle; 50% increase in the motor
4 cost of the compressor could yield a .36 added
5 compressor efficiency. This increase must be viewed in
6 the full relationship of the amount of motor cost to
7 overall system cost.

8 CHAIRMAN IMBRECHT: I going to have to
9 interrupt. I mean, just reading your statement to us
10 verbatim, isn't serving much of a purpose, in my
11 judgment.

12 MR. LEWIS: Well, I guess I...

13 CHAIRMAN IMBRECHT: Can you try to give us
14 the conclusions you're trying to suggest to us. And
15 I've got to....

16 MR. LEWIS: I'll just make one brief
17 statement before I give a conclusion and that is, the
18 reading why in reading it is, I want you know I'm not a
19 noted engineer with Lennox. The information that is in
20 the report is there. And I can speak about it; but in
21 detail, really, it's here. The whole point it's
22 getting to is that in order to move to higher
23 efficiency compressors, which is an intregal part of a
24 outdoor unit, a person would incur or a customer would
25 incur about a 20% increase in order to move the

1 efficiency level that is suggested in the first
2 standard.

3 That 20% increase, of course, directly goes
4 to the consumer. And the reason why we point this out
5 and the summaries, six points there on page 31, that's
6 what we all arrive at; that's the end point. There is
7 efficiency to be gained in compressor motors. It is
8 costly. And it isn't directly.... The efficiency
9 increase is not directly proportional in an SEER value.
10 And to move a full point would cost in excess of 20%.

11 Now we believe that has an adverse, long-term
12 affect, in that, manufacturers will be forced to
13 redesign product to these minimums. And then the real
14 engineering time, which should be spent on advanced
15 systems, is not going into research. In other words,
16 there are items sitting out there just waiting to be
17 challenged which we have time allotted for that would
18 move us into a completely new realm in air conditioning
19 and heat pump design.

20 But when we have these series of interim
21 steps such as the redesign necessary to get to an 8.9,
22 and then the redesign necessary to move to the second
23 standard from 8.9 to 9.9. Those are costly items that
24 a manufacturer has to consider, especially when that
25 first step includes 90% of our product. Those are

1 costly steps. Mid to small manufacturers just can't
2 take those steps; large manufacturers probably can. We
3 presented cases as to how it probably is of the benefit
4 to certain large manufacturers to report separate
5 costing data. Because of their economies of scale,
6 because of their ability to retool and change, the
7 effect upon them is much less than a mid to small
8 manufacturer.

9 Joe McGuire made a comment, according to your
10 questioning, Commissioner, regarding what percentages,
11 mid to small. And he said 10%. I guess since he is an
12 authority and I'm not an authority, I guess I can also
13 make a guess. And that is that the 10% is very
14 conservative number, and could very likely be, in the
15 State of California, in the 25% area. We have a hard
16 time getting that information because there is any
17 central reporting of actually what market share is by
18 different competitors. This report is the first time
19 that we knew Carrier had such a bold 22 percentage of
20 the market place in heat pumps. We just merely point
21 out why it's cost effective for a major manufacturer,
22 and why it's not cost effective to a small manufacturer
23 to make such changes.

24 Then, I guess there are two quick items for
25 me; and Ted needs 30 seconds, he said. First of all,

1 we believe that if the information is suspect on which
2 the basis of an efficiency increase decision is made,
3 we feel like there is really questionable...legally
4 it's really a questionable decision.

5 Secondly, we believe that the amount of work
6 that's gone into this has not been the last minute type
7 work. We have been working right along and have tried
8 to respond even to the latest June 19th document that
9 came out very surprised to us, that we received through
10 the dockets, not even knowing that it was available.
11 And it came out June 19th.

12 Further, Mr. Ted Baily from Carrier
13 Corporation read a letter from Mr. Bob Stevens. And,
14 you know, there's such a thing, I guess, as guilt by
15 association. But I would just point out that in Bob
16 Stevens' letter he doesn't say anything about a 15 year
17 design life for a heat pump. He merely says that the
18 old values that were used and assessed and thought
19 accurate have probably moved up the scale. We, in all
20 of our testimony, have never gone counter to that; we
21 haven't changed our position. We believe though, that
22 the levels that the staff has looked at in their
23 sensitivity analysis are definitely overrated and
24 unbalanced.

25

1 CHAIRMAN IMBRECHT: If you are finished, I'm
2 going to ask our counsel to comment on the questions
3 that you raised relative to the various notes.

4 MR. GILLES: I'll give you my 30 seconds, Mr.
5 Chairman. I do want to emphasize what Dave said about
6 the effect this has on our internal planning. I am
7 Director of Advanced Energy Systems for Lennox and have
8 been for some years. And I am totally dedicated to
9 long-range, highly cost effective equipment. And every
10 time we get involved in one of these it deters that
11 much out of our basic effort towards gas-fired heat
12 pumps. We've got two programs; we've got two thermal
13 energy storage programs; we've got, currently, one
14 advanced electric heat pump program of major
15 consequence. And it's a terrible deterrent to get
16 involved in this.

17 The other thing I want to amplify or may be
18 clarify is the reference to ASHRAE's standard 90.1(p)
19 which is now known as regarding the similar standard
20 that ASHRAE's had through the years past and what
21 transpired at Honolulu. I'm not sure that Mr. Baily
22 was there. I was present at all three sessions on
23 Standard 90 at Honolulu. And the six-person vote to
24 release that document for public review is in no way--
25 --and I assure you--an endorsement by ASHRAE of that

1 document. It was a matter of was a matter of great
2 debate during the conference. There's a front-page
3 editorial on this week's air conditioning news that
4 goes into considerable depth on the subject; so, that
5 issue's far from over.

6 MR. LEWIS: There's even some legal questions
7 regarding that ASHRAE item and that is that the person
8 that chaired the subcommittee is not even a voting
9 member of that Committee and happens to be a major
10 manufacture that has 20% of the heat pump market place
11 in California. I just question whether there should be
12 any kind of weight put or placed on an ASHRAE document
13 that is merely receiving public review.

14 CHAIRMAN IMBRECHT: Okay, fine. I ask you
15 comment on some issues that were raised relative to....

16 MS. DICKEY: I'd like to comment on a couple
17 of the procedural "irregularities" that Mr. Lewis
18 describes. I think there's some misunderstanding here
19 of the legal requirements to which the Commission is
20 subject to pursuant to the Administrative Procedure
21 Act. First of all, regarding his statement about the
22 three phase staff report, the Commission is not
23 required to mail out the three phase staff report. It
24 is only required to make it available on and after the
25 date that the date that the NOPA was public, which was

1 May 10th. The fact that the Commission chose to mail
2 it out on May 8th, two days before the NOPA was
3 published was a courtesy. And the fact that the
4 Commission chose to do that, even before the NOPA was
5 published, was, I think, a significant effort on the
6 part of the Commission's staff to make sure that the
7 parties could have the opportunity to comment. As it
8 was, it clearly exceeded the 45-day requirement of
9 mailing the NOPA.

10 My second comment, is regarding mailing of
11 the 15-day changes. The Commission is not subject to
12 any requirement to issue a notice of 15-day changes or
13 to mail out a copy of 15-day changes. The Commission
14 is, however, required to state in the NOPA itself who
15 may be contacted in the event that 15-day changes are
16 issued. My name was listed in the NOPA. I received no
17 phone calls from Mr. Lewis or from anyone from his
18 company.

19 As a courtesy, two members of the public who
20 had participated extensively in proceedings, such as
21 Mr. Lewis, we drafted up a Notice of the 15-Day Changes
22 and mailed out a copy. The fact that he received the
23 copy of those changes on June 17th is not in any way
24 reflective of a procedural irregularity; it was merely
25 done as a courtesy. Had Mr. Lewis been interested in

1 affirmatively calling me every week, I would have been
2 happy to have received his phone calls. However, I
3 received no such calls from him. And I can only
4 emphasize that with regard to both of these issues, the
5 Commission not only met the legal requirements but
6 exceeded the legal requirements.

7 MR. LEWIS: Well, a quick response. We would
8 be.... I believe it is important that all assumptions
9 that a NOPA is based upon be available to the public.
10 And up to this point, we have not found them readily
11 available. The second item is, I really do not have
12 time to sit at my desk calling every two or three days
13 to see if a NOPA has changed. I just don't have that
14 kind of comfort in my time.

15 CHAIRMAN IMBRECHT: Okay. Does that complete
16 your presentation? Further questions from the members
17 of the Commission? Thank you very much. Next, Mr.
18 Bill Huston representing California Building Industry
19 Association.

20 MR. HUSTON: I think my comments will be a
21 bit shorter than those of Lennox.

22 (LAUGHTER)

23 COMMISSIONER COMMONS: Oh, I thought you
24 were going to stay here and buy us dinner, Bill.

25

1 MR. HUSTON: If we go past 5, I'll do that.
2 Maybe I shouldn't have said that. Pizza King still
3 delivers, don't they?

4 CHAIRMAN IMBRECHT: Let's move this along
5 folks. We've got a lot of other items on the agenda.

6 MR. HUSTON: Basically, my comments are the
7 same as in the letter I addressed to Commissioner
8 Noteware on June 14th; and, I think each of you receive
9 a copy.

10 We have one philosophical difference, having
11 to do with the standard setting procedure and a more
12 practical question on availability of products that
13 actually meet the standard. The philosophical
14 difference, basically, has to do with the take (and it
15 was mentioned by Mr. Varanini earlier today, as well as
16 Marshall Hunt). It's basically taking an option away
17 from the builders and new residential construction.

18 Currently, high efficiency air conditioning
19 and heating equipment is considered against other
20 conservation options, depending upon the design of the
21 structure, the climate zone and the amount of energy
22 savings versus the cost of each of those options. By
23 requiring higher efficiency heating and cooling
24 equipment, that option no longer exist. Although, in
25 new construction, there will be no additional energy

1 savings. So what may, in fact, happen is the builders
2 are required to put in an option (that used to be an
3 option) at perhaps higher cost than another alternative
4 getting the same energy savings. And we're concerned
5 that that can lead to increase housing cost without any
6 increased energy savings because of the performance
7 nature of the standards. The second point has to do
8 with the availability of....

9 CHAIRMAN IMBRECHT: I take it that's not a
10 recommendation that we tighten building standards?

11 MR. HUSTON: I'm sorry.

12 CHAIRMAN IMBRECHT: I take it that not a
13 recommendation that we tighten building standards?

14 MR. HUSTON: That's correct.

15 CHAIRMAN IMBRECHT: Okay. That would be one
16 obvious....

17 MR. HUSTON: Certainly. Philosophically
18 though, the standards are set based on lowest life
19 cycle cost. And clearly by adjusting the standard
20 piecemeal, you're getting away from lowest life cycle
21 cost, perhaps. And that's an entirely different, very
22 major issue though.

23 Availability of products: that has been
24 mentioned by several of the earlier speakers. We have
25 basically the same concerns. Certainly with the '93

1 standard, we're concerned that there are potentially no
2 single package units that will meet that standard.
3 We're concerned about the limited number of models that
4 meet the '88 standard. I suppose, as a compromise, we
5 could accept the '88 standard; but, we really question
6 whether the Commission should set a standard for '93
7 where there is such a limited product availability now
8 and certainly no assurances from other than one
9 manufacturer that that standard is going to be able to
10 be met seven years hence.

11 I can certainly respond to any questions that
12 you might have.

13 CHAIRMAN IMBRECHT: Other questions? Okay.
14 Thank you very much, Bill. I believe Mike Gardner,
15 from Edison, wanted to just briefly addend his remarks.

16 MR. GARDNER: Thank you, Mr. Chairman. Mike
17 Gardner for Southern California Edison. Rather than
18 adding to my remarks, what I would like to do is offer
19 to the Commission one additional document which may be
20 of some assistance to you.

21 I received today a copy of the paper that was
22 presented at the ASHRAE proceedings in Hawaii over the
23 weekend. And I thought it might be useful to you to
24 have that in your record. There is a minor difficulty
25 with it; and, I've spoken with your General Counsel on

1 it. There's some fine print at the bottom which says,
2 "Not to be reprinted in whole or in part without
3 written permission." So, what I would like to do is
4 provide the Commission the one copy that I have. And
5 Mr. Chamberlain has indicated to me that he would seek
6 the written permission to reproduce it. So, I don't
7 think there are new data in it. I think it's the same
8 data that was in the original Alabama Power Study in a
9 slightly different format.

10 Just for your information, the conclusion
11 section indicates that the median age to replacement
12 for the units in the study was twenty years. The range
13 of median replacement life on a manufacturer to
14 manufacturer basis, range from 16 years to over 20
15 years. And interestingly (I'm sure why) but, almost
16 half of the units that were replaced were still
17 functional at the time. They were operable units. And
18 for whatever reason, the consumer chose to replace them
19 with a new model. I don't believe that there are data
20 as to whether that was to achieve a higher efficiency
21 or fresh paint or what.

22 VICE CHAIR CROWLEY: Repossessed.

23 MR. GARDNER: I do not know. Anyway, I would
24 like to offer this for your benefit. And good luck,

25

1 Mr. Chamberlain, in finding out how to get it
2 reproduced.

3 VICE CHAIR CROWLEY: Thank you, Mike. I've
4 lost the list of people.

5 CHAIRMAN IMBRECHT: Does anyone else wish to
6 be heard on this matter? Mr. Baily, your name has been
7 taken in vain a few times. I wouldn't say that
8 necessarily, excuse me. Let me amend that. You have a
9 right of personal privilege, I think, to come forward.

10 MR. BAILY: Thank you. Ted Baily with
11 Carrier, please. Commissioners, I don't intend to take
12 much time. But there is one item that was mentioned
13 that I would like to respond to; because, my name was
14 taken in vain in that respect pretty well. Other
15 things: I think we really beat number of these issues
16 to death in the workshops and the previous hearings.
17 And I think it's all on the record; and, I believe that
18 you will make up your mind on the basis of the record.

19 There was a question raised as to whether or
20 not the distribution of heat pumps in the California
21 market was ARI data or not. That is the question I
22 would like to respond to. There was also a question
23 raised on the same subject in an item that was
24 introduced to the docket on June 26, 1985--today--by
25 the Trane Company.

1 The first paragraph of the Trane Company
2 document reads, "The California Energy Commission staff
3 makes numerous references to ARI shipment data of heat
4 pumps into California. However, this shipment data the
5 staff uses is incorrect and should not be attributed to
6 ARI." The data that is being referred was submitted to
7 the Committee on February 21, 1985 of the hearing at
8 the Southern California Gas Company in Pasadena. On
9 page 45 of the transcript of that day, in response to a
10 question, which appeared on Page 44 from Mr. Pennington
11 about whether or not that data showed a trend, I
12 responded as follows:

13 "I don't know. I think the
14 significant thing would be to look
15 at the 1984 data when it becomes
16 available. But, if you go back and
17 try to create trends, it's
18 difficult to do that. But I don't
19 know what the trend is. All I've
20 tried to do is to pick out the most
21 recent year for which we had
22 complete information to give us a
23 starting point for the discussion.
24 And what I conclude in it is that
25 you can't really make any

1 conclusions from the data as to
2 where heat pumps are used to a much
3 greater extent than others because
4 it's so spotty. It depends on a
5 lot of factors -- the sales effort,
6 the type of distribution, the
7 climatic conditions, the utility
8 incentive programs. There are all
9 kinds of things that affect it. My
10 conclusion is that you can't
11 generalize and say you ought to
12 treat heat pumps differently than
13 air conditioners; because, I don't
14 see that conclusion in the data."

15

16 Mr. Pennington then asked:

17 "When will the 1984 data be
18 available?"

19

20 And I responded:

21 "About a month, Dick Denny
22 says...." (Dick Denny, incidently,
23 is from ARI and was present at the
24 hearing.) And as soon as it's
25 available we can massage that data;

1 because, that's by all sizes. I
2 think it's 65 and below. Is that
3 not? Am I right on that, Dick,
4 without any distinction on the
5 efficiencies of it."

6 Mr. Pennington asked that ARI provide that data as soon
7 as available. I said:

8 "That would be the best place to
9 get it; because, they'll have it
10 available before the members get
11 it.

12
13 Commission Commons asked Rick (referring to
14 Rick Oakley):

15 "Rick could we make that request
16 of you, then, please?"

17
18 Mr. Oakley responded:

19 "Sure."

20
21 And it went on, then, to other information.
22 It seems to me from that dialogue, that the data that
23 was presented by Carrier, in an effort to be helpful in
24 trying to get a line on how heat pumps were distributed
25 in the State of California, was an opening bit of

1 information to start the dialogue. And it was agreed
2 upon by ARI's representative, Rick Oakley, that ARI
3 would provide the 1984 data from which perhaps a trend
4 line could be established. Whether or not ARI provided
5 that data as had been promised, I do not know. It
6 would not appear that that happened.

7 The data that we provided was based on ARI
8 data. We submit trading area shipment movement data.
9 I should say 'movement.' It's when we ship from a
10 distributor to a contractor or a dealer, or at least to
11 that line of distribution. It is reported to ARI; ARI
12 then aggregates the data and sends it back to the
13 members. It is available from ARI by total heat pumps
14 (all kinds), total split systems, total single package,
15 splits less than 5 tons and single package less than 5
16 tons. Now with all that availability of data, I'm sure
17 that any kind of information could have been gotten
18 from ARI both for 1984 and 1983 to establish some kind
19 of a starting trend.

20 Mr. Wolfe, in his comment, goes on to say at
21 the February 21, 22 workshops in Pasadena, Carrier
22 presented, took the staff and attendees the map of
23 Attachment 1, entitled 1983 Industry Distributor
24 Shipments. This map and data was represented Carrier
25 to show ARI member company shipments the indicated

1 California trading areas. This was an incorrect
2 representation by Carrier on four points.

3 One, ARI trading area shipment data is for
4 heat pumps of both single package and split system
5 units combined as a single number. Yes. That's
6 correct and I don't see that it makes any difference;
7 because, we were talking about heat pumps. And we
8 submitted to you data about how those two break down as
9 far as cost and so forth are concerned.

10 Second, ARI trading area shipment data is for
11 both single and three phase equipment combined as a
12 single number. That is correct. I don't see that it
13 makes any difference.

14 Three, ARI trading area shipment data is for
15 all sizes of heat pumps, regardless of size. This
16 means it includes units larger than 65,000 Btu per
17 hour. That is correct. However, I think if you
18 separate the 65,000 Btu and over out of that, it's not
19 going to change the percentage distribution in the
20 State of California even by a 10th; it will be a very
21 small amount.

22 If that were not satisfactory because of the
23 possible variation because of the distribution of
24 greater than 65,000 as opposed to less than 65,000, I
25

1 would say that one should seek the data broken down in
2 the way that it might be broken down by ARI.

3 Item 4: The numbers, as represented, are
4 incorrect ARI numbers. The proper ARI numbers are
5 shown in Attachment 1 (which was the Attachment 1 that
6 I had submitted) in brackets. As the number of heat
7 pump shipments are incorrect, we would expect that the
8 percentage numbers as calculated by Carrier are
9 likewise invalid. There is a difference between the
10 numbers that Mr. Wolfe put in in brackets and the
11 numbers that I submitted. And I'll tell you what that
12 is.

13 Again going back to the statement that was
14 made on the record, that this is based on AIR data, our
15 marketing statistics people expand the data received
16 back from ARI. By expanding, they multiply it by a
17 factor in order to get up to a guesstimate as close as
18 we think we can get to what it would be have all
19 manufacturers' submitted data, rather than just a
20 report back that comes from ARI as submitted.

21 You will notice that the difference between
22 the bracketed numbers and the whole numbers as
23 originally submitted is .85. .85 is the number that
24 the ARI numbers are divided by to achieve the expanded
25 numbers.

1 I agree with everything Mr. Wolfe says; he's
2 absolutely correct. I don't see that it makes any
3 difference whatsoever in this proceeding. Thanks very
4 much for the time. Any questions?

5 CHAIRMAN IMBRECHT: Commissioner Commons.

6 COMMISSIONER COMMONS: Would that 15%
7 represent the small, medium-sized manufacture -- that
8 illusive number?

9 MR. BAILY: I have no idea, Commissioner.

10 CHAIRMAN IMBRECHT: Okay. Thank you.
11 Alright. Does anyone else wish to be heard on this
12 matter? Yes sir, please come forward.

13 MR. DASSLER: My name is Dale Dassler, I'm
14 with the Snyder General Corporation.

15 In listening to the deliberations today and
16 in the past, very little has been said about the three
17 phase equipment and the use of SEER and HSPF on those
18 products. I think it's been pretty well agreed by
19 everyone that these are commercial products and that
20 the only place that you find three phase power
21 available is in the commercial segment. For that
22 reason, I think we ought to all take a real good look
23 at what the commercial load is. I think it was also
24 demonstrated pretty conclusively that the load is
25 different. It is an entirely different load for the

1 same size building. It's a daily load; it's a load
2 that includes a lot of internal heat gain. So
3 consequently, you have a different cycling rate on this
4 product.

5 SEER, as established by the Department of
6 Energy, as a seasonal energy efficiency ratio and it
7 was calculated by a very strange method. We take the
8 temperature of 82 degrees and say this is the
9 temperature that we're going to degrade and take our
10 cycling degradation at that point. That's not the
11 right one if you're going to look at a commercial
12 product. This was done for residential use. The
13 residence, okay. It seems to work fine.

14 If you're going to establish a seasonal
15 energy efficiency ratio for a commercial product, it
16 wouldn't be done in the same manner as it's done in the
17 SEER rating. For that reason, I believe that you would
18 much wiser to continue with EER and COP; because, HSPF
19 has exactly the same connotation to it, it that it's a
20 contrived descriptor related only to residential use.

21 So I believe you'd be much better off to stay
22 with your EER and COP for the three phase commercial
23 equipment. That's all I had to say.

24 CHAIRMAN IMBRECHT: Okay. Thank you. Anyone
25 else wish to be heard? Mr. Rauh.

1 MR. RAUH: Yes. We just had two points we
2 would like to make very quickly in response to two
3 issues that were recently raised.

4 MR. PENNINGTON: First off, we would like to
5 point out that staff did a wide range of sensitivity
6 analysis that looked at possible variations in the
7 benefit side of the equation and the cost side of the
8 equation. And we feel that that sensitivity analysis
9 bracketed all reasonable, possible cases. And we found
10 the standards, both the 1988 level and the 1993 level
11 to be cost effective today under that whole range of
12 sensitivity analyses.

13 Second point that we would like to respond to
14 is the issue of double counting related to the building
15 standards. In the past, the Commission has made a
16 policy of keeping separate, the appliance standards
17 proceedings and conclusions from the building standards
18 proceedings and conclusions. And the building standard
19 would not address efficiency improvements of appliances
20 in their deliberation. So we took as a given whatever
21 conclusions came out of appliance standard proceedings
22 as the baseline.

23 The building standards that we currently have
24 now were based on the assumption of an 8.0 SEER for
25 cooling equipment and did not address any efficiency

1 improvements beyond that. At this point, we have done
2 an analysis on improved efficiency of cooling equipment
3 in a separate proceeding--the Appliance Standard
4 Proceeding--assuming the building standards as the
5 baseline. So, if you will, the cost effectiveness
6 conclusios we've made here reduce and result in lower
7 life cycle cost from the bottom of the buildings
8 standards' life cycle cost curve. So basically, we're
9 not, in any way, double counting. And, in fact, these
10 standard are cost effective off of the bottom of the
11 lowest life cycle cost curve for building standards.
12 Those were the comments we had.

13 CHAIRMAN IMBRECHT: Alright, fine. Thank
14 you. Okay. Commission discussion. You have the
15 courtesy obviously, Commissioner Noteware. Otherwise,
16 I have a few comments I would like make, as well.
17 Please go ahead.

18 COMMISSONER NOTEWARE: Would you like to go
19 first?

20 CHAIRMAN IMBRECHT: Well, I'll give it a
21 shot. For openers, I would just say that, as I -- and
22 I'm being redundant, I realize -- but, I continue to
23 have some skepticism about the second tier that's in
24 the NOPA which is before us for 1993. My feelings with
25 respect to this issue are not dissimilar from what they

1 were with respect to air conditioning. Same time, I
2 would note that there is ample opportunity throughout
3 the remainder of this decade, assuming there are
4 technological advances, etc. that a standard might
5 ultimately be set at that level.

6 I do believe that, in terms of the cost
7 effectiveness analysis of going from the 8.0 to 10.0,
8 that I, frankly, do agree with the perspective advanced
9 by Lennox, that it would have been appropriate in terms
10 of evaluation incremental cost that that evaluation be,
11 first, an 8 to 9 and 9 to 10. That is absent from the
12 evaluation which is before us.

13 I would note and I would agree with some of
14 the comments were made that I think the Presiding
15 Member's Report by Commissioner Noteware was an
16 excellent evaluation of the entire issue. And, I might
17 say, probably the only succinct evaluation of the entire
18 issue which we've had before today, which I appreciate
19 very much.

20 And I would just note that with respect to
21 the lengthy discussion that we also have from Lennox
22 relative to Table 17, that, though, they came forward
23 with no numbers of their own to supplement those other
24 than to...that were presented other than to note the
25 errors, I would just suggest that in the Presiding

1 Member's Report, in fact, those errors were caught and
2 were accurately represented with respect to what were
3 the underlying figures.

4 It does not seem unreasonable to me, looking
5 at the range of numbers that are in his Report, ranging
6 for the split system and focusing now just on the
7 incremental cost of moving from 8 to 9, that a range of
8 costs on Page 9 of his report for split system indicate
9 a low of 121 by Carrier to a high of 231 by ARI
10 incorrectly correctly reflecting the staff's evaluation
11 of 199 with even Trane coming in below the staff's
12 evaluation. It does not seem to me that anything has
13 been presented today that calls into serious question
14 the conclusion of the staff that 199 is, in fact, a
15 reasonable incremental cost for us to render a decision
16 upon. And I would note, in particular, the fact that
17 two major manufacturers both report incremental cost
18 are actually below that which was arrived at by the
19 staff. And moreover that the staff is, as I say, not
20 all that appreciably different from the ARI numbers at
21 231.

22 In essence I would make that same statment
23 with respect to the package units. Again, we've got a
24 range of 103 to 221. Though Lennox suggested to us
25 that the appropriate number in the errata should have

1 been 195, it appears to me from the Presiding Member's
2 Report, perhaps, that might have been 193. But in any
3 case, again, the staff concludes an incremental cost
4 that is actually higher, in this case, by a greater
5 percentage than that which is reported by the two
6 individual manufacturers which did provide the specific
7 data for their incremental cost. Again that suggests
8 to me that there is reasonableness to those conclusion
9 rendered by the staff which in essence have been
10 adopted by the Presiding Member.

11 With respect to the issue of the HSPF levels,
12 and I believe, if I understand correctly that, in terms
13 of the NOPA that have been issued, if we chose to adopt
14 the slightly less stringent number for 1988, namely the
15 6.4, that that was in a subsequent NOPA, then we would
16 have to wait until tommorrow to satisfy the 15 day
17 requirement.

18 May I inquire, is that, would that a
19 cumulative NOPA that would deal with all of these
20 issues or just that singular issue?

21 MS. DICKEY: Tommorrow we could adopt the
22 second version that was made available to the public.
23 And it would not be used exactly as the version that
24 made available on June 12th.

25

1 CHAIRMAN IMBRECHT: I understand. But, that
2 version included the 6.4 but also the other numbers of
3 8.9 and 9.9 for respective dates. Alright. Well, I
4 would just indicate that it's my general inclination
5 that that NOPA would be the appropriate one to adopt,
6 but with the following proviso. And I want to thank
7 Mr. Chamberlain for assisting me -- and Ms. Dickey, as
8 well -- in terms of trying to find a procedural method
9 by which we might be able to reflect my judgment that
10 it would be inappropriate to adopt a second tier today,
11 not only because there is a greater range of numbers
12 relative to the incremental costs. And I think that
13 the foundation for those numbers is subject to greater
14 potential discussion. I don't see the bracketing of
15 the numbers by the various submitters as being within
16 the same relative range as is the case of moving from 8
17 to 9; and moreover, as I indicated earlier, I do think
18 that the appropriate incremental cost would be a 9 to
19 10 rather than an 8 to 10.

20 For that reason, speaking as an individual
21 Commissioner, it would my suggestion that we attempt to
22 adopt to adopt the first tier only and evaluate the
23 second tier. Of course, as I argued with respect to
24 air conditioning standard, as well, at a more
25 appropriate time--at some point later in the 1980s--at

1 which time we could evaluate not only more accurately
2 the impact upon the manufacturing community, but also
3 upon the consuming public of California. While I am,
4 in fact, concerned about the impact upon the
5 manufacturers, it seems to me that our ultimate
6 responsibility does not flow to them, but actually to
7 the consumers of California, both in terms of homes and
8 also in terms of retrofit products as well.

9 I also have some concern from the points
10 raised by the building industry about availability of
11 product, etc. And while appreciate Carrier's position
12 -- they would like to supply all those products -- that
13 raises certain questions of potential monopoly in my
14 mind that I would not like to subject the building
15 community or the consumers of the State to, frankly.

16 It does appear to me, I'm advised however,
17 that since we did not unfortunately publish two separate
18 NOPAs that carried with them both a two-tier approach
19 and also the single-tier approach that we be left, in
20 essence, with only the option from a strick
21 interpretative standpoint of only adopting the NOPA
22 that's before us that carries both tiers.

23 Mr. Chamberlain suggested that if the
24 remainder of the Commision were persuaded, this would
25 be the appropriate approach to take, that we could

1 adopt the NOPA as presented but subsequently adopt an
2 amendment which would direct the staff to only submit
3 to the Office of Administrative Law of the first tier.
4 The question would be and I would presume that there
5 are no -- well, perhaps, that's an inaccurate
6 presumption -- perhaps no parties would challenge that
7 or urge the rejection of the entire regulation on that
8 basis, although it is conceivable that OAL might chose
9 to do so.

10 Were that the case, however, I would just
11 note that the entirety of the regulation would have
12 been adopted and could then be submitted to OAL. And
13 under the terms of AB 191, I believe that we would be
14 in a position to amend that within one year after
15 providing notice to the Legislature. In essence, I
16 would suggest that we immediately provide that notice
17 with the full intention of rescinding the second tier
18 after the passage of the one year time period in June
19 of 1986. I think that's.... Am I actually reflecting
20 your advice, Mr. Chamberlain?

21 MR. CHAMBERLAIN: Yes. And just so that the
22 Commission has full information -- you know, this 191
23 is a very difficult statute. It probably would require
24 a....

25

1 CHAIRMAN IMBRECHT: I notice that
2 Commissioner Varanini is not here to accept
3 responsibility for that. I think he was one of the
4 consultants.

5 MR. CHAMBERLAIN: It probably would require a
6 four-fifths vote at that time. And a finding that the
7 change, since it would arguably result in a decrease in
8 the stringency of the standard, that the change would
9 benefit ratepayers. I think you should know that.

10 CHAIRMAN IMBRECHT: Well, that makes it more
11 difficult, obviously. In any case, that's generally
12 where I'm at. Colleagues, I'll leave to you to express
13 your own judgments about what should be the appropriate
14 action. Commissioner Noteware.

15 COMMISSIONER NOTEWARE: Yes. Mr. Chairman,
16 the staff has done a 9.0 to 10.0 run which finds 10.0
17 to be quite cost effective. In fact, if the cost of
18 increased efficiency decreases by the time that the '93
19 standards take effect, then the standards will prove to
20 be even more beneficial to the consumer.

21 Thank you for you kind words about the
22 Presiding Member's Report; although, it's not totally
23 without error, also. I should point out that we
24 spelled Mr. Baily's name wrong on Page 4. And on Page
25 2, there's a date that says 1/1/96 which, obviously,

1 should be 1/1/93. There are couple of other minor
2 typographical changes which don't affect the end
3 result.

4 I'm a little disturbed. We heard some things
5 here today, which sounded a lot more like a workshop
6 than a business meeting. And I don't feel that we can
7 summarily disregard the statements and the criticisms
8 that were made. Yet, I'm still comfortable with the
9 bottom line in the Presiding Member's Report; and, I'm
10 comfortable with our staff's report which leads to the
11 conclusions.

12 I want to point out that the downside of not
13 adopting standards now, obviously would be that we be
14 faced with over a year from now coming up with some
15 standards that would specify, or coming with a document
16 that would specify standards for 1988. And it would be
17 very, very difficult in the short timeframe then that
18 would be provided for the manufacturers to meet these
19 standards. And I think rather than go through that I
20 still feel that what we have here is realistic and in
21 the best interest of the citizens.

22 CHAIRMAN IMBRECHT: Okay. Thank you.
23 Further comments? Commissioner Crowley.

24 VICE CHAIR CROWELY: Mr. Chairman and
25 Commissioners, I concur with that. I believe that,

1 because we have already established a two tier for
2 another level of air conditioner size, that it would be
3 appropriate to be in harmony with that and that it
4 would not be as beneficial to have one tier; because, I
5 believe that we have time to modify the second tier
6 since it does not take effect until 1993 and even, were
7 it to be modified, in the meantime, it provides a
8 signal to the industry that I think is helpful. So I
9 believe that the recommendation by the Presiding Member
10 is the appropriate thing for us to do in this
11 situation.

12 CHAIRMAN IMBRECHT: Commissioner Commons,
13 you're uncommonly silent.

14 COMMISSIONER COMMONS: Nods -- No, indicating
15 no comment.

16 CHAIRMAN IMBRECHT: Alright. Fine. What's
17 the pleasure of the Commission?

18 COMMISSIONER NOTEWARE: Well, Mr. Chairman, I
19 move to adopt the recommendation from the Presiding
20 Member's Report.

21 CHAIRMAN IMBRECHT: Is there a second?

22 COMMISSIONER COMMONS: Second

23 CHAIRMAN IMBRECHT: Seconded by Commissioner
24 Commons. Let me just make an inquiry. Relative to the
25 matter of the 6.6 versus 6.4 that....

1 COMMISSIONER NOTEWARE: I still feel that 6.6
2 is the right way to go.

3 CHAIRMAN IMBRECHT: Alright. Fine.

4 VICE CHAIR CROWLEY: And that's Alternative
5 2?

6 COMMISSIONER NOTEWARE: Alternative 2.
7 Right.

8 CHAIRMAN IMBRECHT: Alright. Is there
9 further disucssion?

10 MR. CHAMBERLAIN: Mr. Chairman?

11 CHAIRMAN IMBRECHT: Yes.

12 MR. CHAMBERLAIN: According to Ms. Dickey,
13 there are four amendments before you. I'll let her
14 explain.

15 CHAIRMAN IMBRECHT: Alright.

16 MS. DICKEY: I believe the Commission needs
17 to take action on the four different amendments. We
18 have been primarily discussing or specifically
19 discussing the amendment to 1604(c) which actually sets
20 forth the standard. However, there is an amendment
21 proposed for 1602(c) which would define the term
22 'heating seasonal performance factor.' As the
23 regulations now read, that term is undefined; and,
24 leaving that term undefined would cause a clarity
25 problem.

1 Amendment has also been proposed to Section
2 1603(c) which relates to, I believe, the test methods
3 for heating seasonal performance factor--or excuse me--
4 -for heat pumps. And since we're setting these
5 standards, we do need to bring our test procedures into
6 harmony with that.

7 Additionally, there has been a change
8 proposed to Section 1606(c) which would merely update
9 the title of the form for certification of air
10 conditioners and heat pumps. So I would just recommend
11 to the Commission that you take action on all four.

12 VICE CHAIR CROWLEY: Those are all in the
13 Presiding Member's Report.

14 CHAIRMAN IMBRECHT: Those are all encompassed
15 within Commissioner Noteware's report and, therefore,
16 would all be encompassed with a motion.

17 COMMISSIONER NOTEWARE: That was our intent.

18 COMMISSIONER COMMONS: Point of information.

19 CHAIRMAN IMBRECHT: Commissioner Commons.

20 COMMISSIONER COMMONS: Commissioner Noteware,
21 I assume your motion included both heat pumps and three
22 phase.

23 COMMISSIONER NOTEWARE: Yes, it does.

24

25

1 CHAIRMAN IMBRECHT: Further discussion? Is
2 there an objection to unanimous roll call. Hearing
3 none, ayes: 4; nos: none. The motion is adopted.

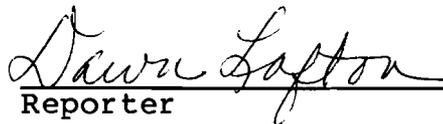

4 (Thereupon Item 1 of the Business Meeting of
5 the California Energy Resources Conservation and
6 Development Commission was adjourned at 3:45 PM.)

REPORTER'S CERTIFICATE

1
2 THIS IS TO CERTIFY that I, Dawn Lofton,
3 Reporter, have duly reported the foregoing proceedings
4 which were had and taken in Sacramento, California, on
5 Wednesday, June 26, 1985, and that the foregoing pages
6 constitute a true, complete and accurate transcription
7 of the aforementioned proceeding.

8 I further certify that I am not of counsel or
9 attorney for any of the parties to said Business
10 Meeting, nor in any way interested in the outcome of
11 said Business Meeting.

12
