(AB 758 Program))

Staff Workshop on
Comprehensive Energy Efficiency Program
For Existing Buildings (AB 758)
Scoping Report

California Energy Commission
 Hearing Room A
 1516 9th Street
 Sacramento, California

Tuesday, October 9, 2012
 9:06 A.M.

Reported by:
 Peter Petty

APPEARANCES (*Present via Telephone)

COMMISSIONERS

Andrew McAllister, Lead Commissioner, Energy Commission

ADVISORS

David Hungerford, Advisor to Commissioner McAllister

Grant Mack, Advisor to Commissioner Weisenmiller

STAFF PRESENT

Dave Ashuckian

Martha Brook

Christine Collopy

Justin Regnier

Monica Rudman

Bill Pennington

PRESENTERS

*Cody Taylor, US Department of Energy

*Andrew Burr, Institute for Market Transformation

PANEL 1

Mimi Frusha, Renewable Funding

David Jacot, LADWP

Steve Schmidt, High Energy Audits

Fran Inman, Majestic Realty

Cassie Bowe, SunPower Corp.

PANEL 2

Alecia Ward, The Weidt Group

Denny Mann, Marina Mechanical

Karl Brown, California Institute for Energy & Environment

*Mike Kaplan, Retroficiency

Lin Ortega, County of Santa Clara

PANEL 3

Carol Zabin, UC Berkeley's Center for Labor Research & Education

Bill McNamara, Energy Management & Design

Jenna Olsen, Pacific Gas & Electric

Derrick Rebello, QuEST - Oakland Shines

PUBLIC COMMENT

Gina Goodhill Rosen, Global Green USA

Mike Kessesee, SMUD

*Becky Menten, Marin Energy

Conrad Asper, CBPCA

Simon Baker, CPUC

Al McBride, SMART Light Systems

Ted Reguly, SDG&E

George Nesbitt, CalHERS Rater

Matthew Hargrove, California Business Properties Association

David Cohen, The Energy Coalition

Cheri Davis, SMUD

Sean Layerle, TRC Solutions

P R O C E E D I N G S

1
2 OCTOBER 9, 2012

9:06 A.M.

3 MR. ASHUCKIAN: Thank you for all coming to day
4 two of our 758 workshop.

5 I see many of you, if not most of you are here
6 for day two, although there are a few faces that are
7 new, so I will do a little bit of repeating what I
8 talked about yesterday in the introduction, mostly about
9 how the day's going to operate.

10 So, just briefly, again, about activities to
11 date, again we've done some ARRA programs that include
12 financing and the Energy Upgrade California, met some
13 targeted nonresidential programs. These have been,
14 basically, the kind of pilot programs for AB 758 work.

15 The program's going to be set up in three
16 phases. This is the first phase, which is the program
17 development and action plan. And as we talked about
18 yesterday, this workshop is helping to develop that
19 plan.

20 The scoping report, which was published with
21 this workshop, is kind of the comprehensive overview of
22 the program or of the issues surrounding energy
23 efficiency.

24 And as a result of these workshops and two
25 additional -- at least two additional workshops that

1 will be held in either Northern, and/or Southern, or
2 Central California we will have comments on the draft
3 action plan.

4 From there we expect to go into phase two, which
5 is the market development and developing the
6 partnerships. It's kind of ramping up the
7 infrastructure to get the energy efficiency going.

8 And then phase three would be widespread
9 implementation followed, potentially, by some specific
10 regulations that will help facilitate more widespread
11 energy efficiency in existing buildings.

12 So, I just went through phase one. Sorry, I'm
13 not keeping up with myself here.

14 Next steps, again written comments, after this
15 workshop, are due two weeks from today, October 23rd.
16 Again, we plan to have the draft action plan out by
17 about the end of December. And the workshops will be
18 held probably in January or early spring, with a planned
19 adoption by the Energy Commission in early March -- or
20 in March, I should say.

21 And, again, we are heavily coordinating our work
22 with the PUC and the expectation would be that a lot of
23 these programs would be implemented by the IOUs in their
24 energy efficiency portfolios.

25 Today's workshop is going to be on -- basically,

1 focused on data collection and nonresidential programs,
2 nonresidential buildings.

3 We'll have, actually, three presentations; an
4 opening presentation by Martha, talking about the market
5 characterization and a little bit about the potential
6 energy efficiency reductions available from existing
7 buildings.

8 Then we'll have two other panels about -- one on
9 the DOE program and then, again, the two additional
10 panels on nonresidential buildings, one on performance
11 and one on tools and upgrades.

12 Again, we're using the blue cards today, again.
13 We had a lot of cards yesterday, some of them, about 15
14 cards didn't get answered because of the participation.

15 What I'm going to ask folks today, if you have a
16 comment that you think is a quick comment that is not
17 going to require dialogue, if you could put a note on
18 your card, you know, "quick comment" that way we'll try
19 and maybe make it in so that people can make a comment,
20 rather than devoting a lot of time for various
21 questions.

22 If you have a question that's certainly
23 encouraged as well, but I want to be able to just get a
24 better gauge of how many -- we're trying to get through
25 more folks. So, if you can make that notation on there.

1 Also, please, if you have a comment that you
2 want for a specific panel, if you turn your card in
3 early, please put down the panel number or even the
4 question number that you are trying to -- you want to
5 have questions about or comments on. That will, again,
6 help organize the questions.

7 As I mentioned yesterday, and as everybody
8 experienced here, for the new folks, we're doing what's
9 called question mapping so that every panelist has been
10 assigned one or two, or two or three questions out of
11 the group, so that each panelist will not be answering
12 every question.

13 We certainly encourage participants from
14 answering any of the questions.

15 And in addition to that there are a group of
16 questions at the end of the agenda that we have not
17 assigned to any specific panel. Again, we encourage
18 questions, and comments, and written comments on those,
19 as well.

20 Housekeeping, restrooms are across the way.
21 There's a snack bar on the second floor, it closes at --
22 just kidding.

23 Emergency exits, the main doors to the right and
24 there's emergency doors to the left. The emergency
25 doors to the left will sound the alarm if you use them

1 without a key card, so don't exit those doors without a
2 key card. And once you exit those doors you can't get
3 back in without a key card.

4 So, if there is a fire alarm, we congregate
5 across the street at the Roosevelt Park, which is
6 kiddie-corner from the building.

7 And again, with your blue cards, if you have
8 comments please be sure to state your name and the
9 company you're representing.

10 Are there any questions?

11 Okay, with that I think we'll start with Martha.
12 Oh, yeah, sorry, sorry.

13 COMMISSIONER MC ALLISTER: I'll just chime in
14 and say thank you all for coming again. Yesterday was a
15 great set of discussions and there are some familiar
16 faces who were here yesterday, as well. So, also
17 appreciate the PUC sticking it out, so thanks Simon and
18 crew for being here for the second day, as well.

19 So, hopefully -- I think we have a good
20 foundation for a productive discussion today as well, to
21 get through the rest of the topics. And looking forward
22 to today, thanks again for coming.

23 MS. BROOK: Good morning, I'm Martha Brook. I'm
24 an engineer here at the Energy Commission and I've been
25 here too long. So, I think that -- well, in relative

1 terms, I've been here over 20 years which is I think,
2 maybe, my testament to my lack of imagination, maybe,
3 I'm not sure.

4 (Laughter)

5 MS. BROOK: So, anyway, what I'm going to do is
6 talk about the charts that were in the scoping report
7 and there's a little bit more information here than in
8 the scoping report because I just dug in a little bit
9 more the last few days because I just love this stuff,
10 and any time I have an opportunity to dig into the data,
11 that's what I try to do.

12 COMMISSIONER MC ALLISTER: That's actually why
13 you're still here, Martha.

14 MS. BROOK: Yeah. So, anyway, the sources for
15 the data that we've looked at briefly here for the
16 scoping report, and to sort of understand more about
17 commercial and residential buildings are the Energy
18 Commission's Demand Forecast, which we produce -- it's a
19 long-term forecast and we collect data in order to
20 produce those forecasts.

21 And, principally, the survey data that we've
22 looked at here is the 2009 Residential Appliance
23 Saturation Survey, that's the RASS, and the 2003
24 Commercial End Use Survey, the CEUS survey.

25 So, this is just to get everybody on the same

1 page. Residential and commercial buildings are the
2 majority of electricity consumption, coincident peak
3 demand. So, just residential and commercial buildings
4 are 70 percent of electricity consumption. About 80
5 percent of the peak demand is due to residential and
6 commercial buildings and more than half of the gas
7 consumption are also residential and commercial
8 buildings, so, no big surprise.

9 We have a big contribution to the State's energy
10 consumption are in these buildings that we're trying to
11 address in our 758 Program.

12 So, we're going to spend about half the time
13 looking at residential data and then the second half
14 looking at commercial characterization data.

15 So, this also is no surprise to anyone, we have
16 a lot of old houses in the State and this is, you know,
17 one of the -- one of the focus points for this 758
18 legislation was to look at older homes and to figure out
19 ways that we can bring those older homes forward in
20 terms of the energy efficiency paradigm.

21 So, almost 60 percent of buildings were built
22 before any State Building Codes, and then about 10
23 percent every decade after that.

24 And I should say that that last decade, that's
25 forecasted data, so it's probably more optimistic in

1 terms of new construction than what we'll realize. So,
2 we're probably, again, maybe that 11 percent drops to 9
3 or 8 percent in terms of the overall sector.

4 So, again, the focus for our work really needs
5 to think about that diversity across construction
6 performance that we would anticipate in these buildings,
7 with really a target on that 60 percent of older
8 buildings.

9 This is just a way to look at what's going on in
10 the residential sector in terms of end use electricity
11 use in this case.

12 And one of the things that I really take away
13 from this chart is that we're expecting, you know,
14 fairly static or no growth in the end use electricity
15 consumption in houses, except for that "other" category
16 which is basically, if you look at everything else
17 that's already been itemized in the residential survey,
18 it's really plug loads.

19 So, it doesn't even include televisions, and
20 VCRs, and things that are in that entertainment
21 category, it's all of the things that we do with our
22 pocket devices, our consumer electronics that really is
23 the sole reason that the whole sector is expected to
24 grow in the future is new homes and that consumer
25 electronic or "other" plug load category is expected to

1 continue to increase within existing homes.

2 So, this next slide is just a way of looking at
3 kind of the vintages of homes and how space conditioning
4 end use sort of varies across these performance levels
5 or, you know, the decade categories or code categories
6 of homes.

7 So, basically, if you look at the oldest houses,
8 if you looked at what the space conditioning unit energy
9 consumption, that is if you have heating and air
10 conditioning in your home, it's expected to use over
11 2,000 kilowatt hours per year if it's in that decade of
12 an older appliance and an older home.

13 Whereas if you look at the newest construction,
14 that same air conditioning equipment and heating
15 equipment is expected to use far less than that, you
16 know, less than 1,000 kilowatt hours per year.

17 And the difference between that, it's not just
18 equipment. Obviously, we've done a lot to improve the
19 envelope of these buildings, which allows the air
20 conditioner to work and meet loads much more
21 effectively.

22 But the red columns in this chart show that even
23 though older equipment is less efficient, it's not
24 giving -- it's not producing more energy in the use of
25 these older homes. And that is due, to the greatest

1 extent, to the fact that a lot of older homes don't have
2 air conditioning equipment.

3 So, the unit energy consumption is really only
4 relevant if that equipment is in your house and you're
5 using it, right.

6 So, two things in older homes, they don't always
7 have air conditioning equipment and often they probably
8 are living with different comfort conditions because
9 they can't always afford to use their air conditioning
10 and heating equipment because their bills would be so
11 high if they did use it, because they're so ineffective.

12 So, this chart just shows you that even though
13 we expect older equipment to be much less efficient, the
14 usage of this equipment isn't more than in new
15 buildings. In fact, the usage in new buildings is more
16 because everybody has that equipment and, therefore,
17 they're using it more often because it's available for
18 them to use.

19 And I'm going to come back to this slide when we
20 talk about the scenarios just a little bit.

21 So, the next thing that we looked at for the
22 scoping report is, you know, the distribution in the
23 residential sector of -- this is at the whole house
24 level, how much electricity the house is expected to use
25 versus at a statewide level how much electricity is

1 being used by this category of homes.

2 So, across the bottom of the chart you have bins
3 of house unit energy consumption, so how much the house
4 is expected to use. And then the height of each bar is
5 statewide how much that category of home is using over
6 the course of a year.

7 So, this is where you get that average, a lot of
8 us typically say 7,000 kilowatt hours a year for a house
9 in California. Well, this is where that number comes
10 from because it's the highest bar in this distribution
11 is that 7,000 kilowatt hours a year.

12 And so really the point that we're trying to
13 make in this chart, really is that one, there's a wide
14 spread. There's houses that don't -- there's a lot of
15 energy that is being consumed by houses that are less
16 than that average. And there's, you know, a significant
17 tail, also, of high end users that we need to consider
18 when we're thinking about program designs to implement
19 energy efficiency.

20 So, the point here is that there's potentially
21 different messaging and different program designs that
22 we would want to consider when we're trying to reach
23 each of these different classes of customers. Customers
24 that use a lot of energy, you know, everything above
25 10,000 kilowatt hours a year.

1

2 So that whole right-hand tail of this
3 distribution curve potentially has a different program
4 design than an average user or a house that uses much
5 less than average.

6 So, for example, SMUD and other utilities have
7 already done this kind of peer group, showing customers
8 what they use compared to their neighbors. So, it's
9 sort of a shame game type of a program design where you
10 get people kind of excited that they might be using more
11 than their neighbors, and they begin to investigate why
12 that might be.

13 So, certainly, high end users also could -- and
14 I think some of the ARRA work where there's been whole
15 house upgrades, that we heard about yesterday, have
16 actually addressed this high end user where they're
17 spending a lot of money for electricity because they're
18 at that highest rate tier.

19 And, therefore, they see huge value to their own
20 pocketbook in efficiency improvements because it drops
21 them out of that high end tier into a more affordable
22 rate level.

23 And the most typical consumers might react
24 differently and need a different kind of a program
25 design. As is, you know, lots and lots of buildings

1 that are using less than average and either because
2 they're in mild climate zones or, again, they don't have
3 the same level of services and haven't gotten used to
4 the levels of services that are in bigger and newer
5 homes. And maybe there's a different program design
6 that's necessary for those types of consumers.

7 So, that was really the point of this slide is
8 to begin to think about the distribution across the
9 State in terms of consumption in homes and how much they
10 contribute overall to the statewide electricity
11 consumption.

12 So, this is the scenario chart that I wanted to
13 spend a few minutes on. It has an additional trend that
14 isn't in the scoping report scenario chart.

15 So, let me just walk through this and then when
16 we get to the end I think we have plenty of time for
17 questions.

18 So, the first blue dash line is the CEC demand
19 forecast and it probably has a little bit more new
20 construction starts than what the Energy Commission's
21 standards anticipated, for example, in the 2013 update.

22 So, maybe that curve is a little bit more steep
23 than we would expect.

24 But the next trend line, this red dash line is
25 the zero net energy trend and this actually has made

1 it -- we did make an adjustment for a more shallower
2 trend for new starts, so it actually matches better what
3 our anticipated starts were for the 2013 standards, for
4 example. So, that's a legitimate trend line.

5 And one thing I should back up and say is that
6 the way that we organized this chart is that every
7 horizontal grid line is equivalent to three power
8 plants. There are three Rosenfelds, which is 3,000
9 gigawatt hours a year.

10 So, it's a real easy way to say what kind of an
11 impact any of these scenarios might make is just to look
12 at, for example, the zero net energy trend line is
13 almost nine power plants, maybe eight power plants.

14 So, when anybody asks us why we're doing zero
15 net energy that's what we can tell them, it's because we
16 want to save, you know, potentially up to eight power
17 plants in the future, in California.

18 So, what we did for the rest of the trends for
19 existing buildings is just assumed that the zero net
20 energy goal that we have in the State is achieved. And,
21 therefore, as you can see, all the other trends sort of
22 follow that same growth line.

23 And the reason that that ZNE trend line is still
24 increasing over time are those miscellaneous loads, the
25 consumer electronics in existing buildings that we

1 anticipate will grow over time.

2 So, we'll just keep attaching things to our
3 bodies and they all need to be plugged in, right, at
4 night. So, that's the forecast that -- that's the
5 forecast that we've projected here. I think I skipped
6 there.

7 So, the next line that I want to talk about is
8 this green line. That's the 2013 through 2016 IOU
9 economic potential that is guiding the 2013-14 portfolio
10 planning effort.

11 And really the only -- you know, the estimates
12 that were taken from that potential study stop at 2016
13 and then the trend just sort of picks up the zero net
14 energy trend line.

15 So, just as a disclaimer, the economic potential
16 didn't go out to 2040, it went out to 2016 and then we
17 just extended that line out.

18 So, you can see that what the IOUs are trying to
19 achieve, and at least the goal that the PUC thinks is
20 achievable is in existing residential construction -- is
21 north of two power plants, but maybe less than three.

22 So, the next two trends that I want to talk
23 about are the two blue lines. That's this trend and the
24 other blue trend. Those are both from the Long-Term
25 Energy Efficiency Strategic Plan.

1 The dark blue line is 25 percent of homes
2 decrease electricity by 70 percent by 2020. And the
3 lighter blue line is that three-quarters of homes
4 decrease electricity by 30 percent by 2020.

5 So, both are very aggressive goals and, you
6 know, have significant power plant savings as depicted
7 in this chart.

8 So, the intent here is just to say, well, if 758
9 did have a quantitative goal where should it be?

10 And so we tried to put everything on this chart
11 that we know about, that people have talked about, that
12 are in policy documents in the State, and then added a
13 couple just for discussion purposes.

14 So, the two that we've added for discussion
15 purposes are that purple line, which is quite similar to
16 the blue lines in terms of -- in terms of impact. But
17 it's basically saying that if we did something like a
18 whole house upgrade program where the asset energy used,
19 the permanent features, and not behavior-driven, but
20 more permanent features of homes are improved by up to
21 40 percent by 2030 in the majority of homes, where would
22 it end up in the -- in an efficiency scenario such as
23 this?

24 And it's very significant, but also quite
25 similar to these long-term strategic planning goals in

1 terms of impact. And they're all very, very aggressive.
2 But maybe help us think about, you know, aspirational
3 goals or just exactly how much we do want to accomplish
4 with our 758 program.

5 Then the other yellow line I just added in, it's
6 not in the scoping report. And I started thinking about
7 these pre-code homes, and one of the directions from the
8 758 legislation is to focus on pre-code homes and bring
9 them up to a relatively advanced level of energy
10 efficiency.

11 So, what it says here, pre-code homes increase
12 efficiency 10 percent by 2025.

13 And the way I got to that 10 percent is back on
14 this chart. I said, okay, let's assume that these pre-
15 '75 houses move to the next level of performance, about
16 1500 kWh per home, and so it's about over 60 percent
17 improvement.

18 So, the oldest homes get to the middle of this
19 chart and then the middle of the chart get all the way
20 to the current level of home performance. So, that just
21 is a way to say, okay, pre-code, well that's everything,
22 right, because we keep changing our code every three
23 years so -- but we're not going to assume for this
24 exercise that these oldest homes get all the way up to
25 current levels of performance, but they get halfway

1 there.

2 So, that's where we did the math and came up
3 with -- sorry for that -- if you take that level in
4 terms of space conditioning use, and do the math in
5 terms of the contribution of space conditioning to the
6 total electricity consumption of the home, and then you
7 upgrade those code levels, you get to approximately 10
8 percent of the whole house electricity use for those
9 pre-code homes. And that's what it looks like on the
10 chart.

11 It's also assuming that some of the homes have
12 already been upgraded, right, so it's not saying -- it's
13 not making the assumption that nobody's ever touched any
14 of these older homes that would be unrealistic.

15 So, anyway, a type of a scenario that would
16 focus on pre-code homes in improving the efficiency in
17 terms of envelope or space conditioning improvements
18 would yield almost three power plants.

19 So, that is all I have for residential, I'm
20 going to move on to commercial buildings.

21 So, this was the first chart I wanted to talk
22 about for commercial buildings and I think this is
23 really important for today's discussions, where we're
24 going to talk about commercial building upgrades, and
25 also planning for the action plan.

1 So, what this looks like is all these
2 abbreviations on the bottom are building types, it's
3 college, grocery stores, health -- you know, hospitals
4 and healthcare buildings, lodging, large office,
5 miscellaneous, refrigerated warehouse, restaurants,
6 retail, schools, small offices and non-refrigerated
7 warehouses.

8 And the red bars are the counts of buildings
9 based on the CEUS survey, with the weights included in
10 there, so it's not perfectly accurate but it's a good
11 estimate.

12 And then the blue line is the statewide
13 electricity consumption for these buildings.

14 So, right away you see that miscellaneous and
15 retail are huge in terms of their overall contribution
16 to the electricity consumption in the commercial sector,
17 and all the other buildings really pale in comparison to
18 those.

19 And I must say as one additional disclaimer,
20 colleges are under-represented in this data sample that
21 we analyzed because this is a non-confidential version
22 of the CEUS data that we looked at and we had to strip
23 out large colleges out of this -- out of this dataset
24 for confidentiality reasons.

25 And so I didn't make adjustments for that in

1 this data analysis. So, colleges probably rise a little
2 bit higher is basically what I'm saying, but I don't
3 think it changes the -- what I hope to -- for the
4 takeaway of this chart to be basically is that
5 miscellaneous and retail are the largest contributions
6 to the commercial sector's electricity consumption.

7 So, if we dive into that just a little bit more
8 another really interesting thing about these building
9 segments is that they're dominated by small buildings.

10 So, those same two building sectors,
11 miscellaneous and retail, and we're just looking at the
12 counts of buildings by size, and as you can see the
13 smallest building sizes dominate and tail off quickly.
14 So, they're all reasonably small and most of them are
15 very small buildings.

16 And this is huge for program design purposes. I
17 mean, you know, anything that addresses class A office
18 buildings is not going to address these market segments.

19 So, this is really important, I think, for our
20 planning purposes.

21 Just dive down another, just because I can't
22 resist, so one more dive down, this is what those
23 miscellaneous buildings are. I mean miscellaneous is
24 not helpful, right. So, saying that there's a lot of
25 miscellaneous buildings is not going to help us in

1 trying to figure out what we can do about it.

2 So, this is just the characteristics of
3 basically what these buildings are. They're churches,
4 or convenience stores, or fitness centers, they're gas
5 stations, they're manufacturing facilities. They're all
6 the little concrete tilt-up buildings we have across the
7 State.

8 Police and fire stations, post office, public
9 assembly facilities, service buildings, and then the
10 miscellaneous of the miscellaneous, things we really
11 just don't what the heck they are. But we know they're
12 buildings, that's all we can say for sure is that
13 they're a building.

14 (Laughter)

15 MS. BROOK: So, once again, lots of lots of
16 small, weird buildings. And those are the ones that
17 we're going to have to address if we're going to be
18 successful with our goals.

19 Another like end use snippet for the commercial
20 sector, we don't see the same growth in the
21 miscellaneous. And, again, this is from the Forecast
22 Office and I would challenge that maybe there ought to
23 be more growth anticipated in that miscellaneous sector
24 because if we've got all these things attached to our
25 buildings and we forget -- or our bodies, not our

1 buildings, and we forget to plug them in at home what
2 are we going to do? I've already got three things
3 plugged into my office upstairs.

4 So, I expect there to be growth in that consumer
5 electronics that get drug into the commercial sector. I
6 don't think our forecast is capturing those.

7 So, when we go to the scenario chart you'll see
8 it looks a lot different from residential because we
9 don't have that growth in the miscellaneous sector.

10 But anyway, the things you would anticipate,
11 indoor lighting dominates miscellaneous, also, it's very
12 significant. And cooling and ventilation are trailing
13 close behind.

14 And then the other thing that's really important
15 for commercial buildings is -- again, because I'm a
16 mechanical engineer, you know, cooling just has to be
17 dominant on one chart that I show, and so this is a
18 chart that I want to show.

19 Lighting is important always, but for coincident
20 peak in the State cooling in commercial buildings is
21 very, very important, so that's the point of this chart.
22 And again, this isn't in the scoping report. I saw that
23 cooling was neglected in the scoping report and so I had
24 to toss this one in there.

25 Okay, so commercial scenario chart looks like

1 this. This does have one added -- one added trend from
2 the scoping report.

3 But anyway the different -- the same thing here,
4 the blue dotted line is the CEC forecast. The ZNE red
5 dotted line is shown here, very impactful. In this case
6 it's, again, a good eight power plants.

7 The difference in the ZNE trend is that it shows
8 no growth over time and that's because the only growth
9 in that forecast is due to new buildings. So, again,
10 because there is no growth anticipated in the forecast
11 for those miscellaneous loads once you've cut out the
12 growth from the Zero Net Energy program, that's why the
13 trends flattens out where you didn't see it flatten out
14 in the residential sector.

15 So, again, the green line is the 2012 to 2016
16 economic potential as sponsored by the Public Utility
17 Commission and is guiding the '13-'14 program planning
18 that's going on.

19 The significance, you know, six power plants
20 worth of potential there.

21 This bright blue line is the aspirational goal
22 that was in the strategic plan that half of our existing
23 buildings are going to get to zero net energy by 2030.

24 So, we've solved the -- we've saved polar bears
25 if we get there. I mean we basically -- we're getting

1 back to the 1990 levels of greenhouse emissions and
2 buildings that, you know, is trying to get achieved by
3 the AB 32 goals. We would have achieved that and then
4 some if we actually were able to achieve this zero net
5 energy goal for existing buildings.

6 So, I think this -- having this on this chart is
7 a nice sort of kind of bounding the levels of
8 achievements we may be able to achieve.

9 And then this purple line, again, is if we did
10 something with 758 -- again, this isn't blessed by any
11 agency, this is just staff putting lines on a chart for
12 discussion purposes. But if three-quarters of the
13 buildings, commercial buildings, were to decrease their
14 asset energy use, again those permanent features of
15 buildings that would trade if the -- that would go along
16 with the building if there was a change in ownership.
17 If those were -- the efficiency of those assets were
18 increased by 40 percent by 2030, it would be this purple
19 line. And that, you know, taken off of the ZNE trend
20 line is three, six, nine power plants.

21 And then the only other thing I added here, just
22 for discussion purposes is -- well how -- you know, that
23 purple line looks really, really aggressive and how
24 would we achieve that?

25 And so what I did, as another scenario to

1 compare that to is, well, what if we took lighting?
2 That's the most common measure that's incented in
3 commercial buildings today, what if we continued to
4 increase lighting by 30 percent in half the buildings in
5 the State, what would that look like?

6 And it seems very aggressive but it doesn't --
7 it pales in comparison to these other kind of potential
8 savings that we get from other scenarios.

9 So, it's significant. It's, you know,
10 potentially two power plants, that's nothing to sneeze
11 about so that's great.

12 But just looking at one major end use in
13 buildings is -- doesn't produce the same significant
14 levels of savings and maybe the things we want to think
15 about for 758 as more aggressive, whole building
16 approaches might.

17 So, that's the point of that scenario and I
18 think we're ready to talk about this, now, if people are
19 interested in that.

20 What's that? I guess so. So, Commissioner, did
21 you want to talk at all about -- I know yesterday there
22 were people that were -- actually, I was kind of
23 confused yesterday, people were saying, well, if we want
24 to meet our program goals we should do this. And I
25 don't know that we set program goals, so that's what was

1 confusing to me yesterday.

2 And so that was actually one of the points of
3 these scenarios is to look at where would we land on a
4 758 program? Do we want to put a mark in the sand in
5 terms of what a quantitative goal is or do we want to
6 just say we're happy if -- if we just save energy for
7 consumers?

8 COMMISSIONER MC ALLISTER: Well, I guess so in
9 the scoping report, back and forth, when we were really
10 trying to figure out sort of what to put in there and
11 what to focus on, you know, you came up with some
12 initial drafts of these graphs and it was a really good
13 fodder for conversation internally here.

14 And I think what we came away with is that
15 there's kind of a -- there are a number of questions
16 about how we parse not only these scenarios, you know,
17 what scenarios we're going to take seriously, but also
18 as we identify policy actions and then we try to dig
19 into them and see what impact they might have, that will
20 produce some scenarios.

21 Okay, we want to do -- okay, this is a big lift
22 for a few savings. I mean we don't know all this, yet,
23 we're trying to gather the information about our policy
24 options.

25 So, it does -- so what emerged was this theme of

1 do we want sort of broad versus deep, right. Do we want
2 really to go deep with some subset of buildings or do we
3 want to be as broad as possible and kind of at the
4 individual building level settle for maybe not as
5 aggressive interventions.

6 I think that's an open question and I'm
7 pragmatic about it. I want to do what kind of gets us
8 furthest down the road.

9 There are a lot of paths -- I think it could be
10 useful to establish a point B, you know, where how we --
11 okay, here's our overall goal in some very macro way,
12 but there are going to be many, many pathways between
13 where we are now and that second point.

14 And so I would invite kind of people with
15 specialty knowledge or detailed knowledge about any
16 given sector today and, you know, nonres, primarily, to
17 offer ideas about where -- you know, what about the
18 broad versus deep problem at the Commission, and I think
19 the regulatory community we always talk about, okay, if
20 we touch a building do we really want to sort of make
21 sure we harvest everything because we may not get the
22 change again?

23 Well, I think that may be true for many
24 buildings, but it may not be true in other buildings.
25 We may -- if we don't do something now, we may not do

1 anything ever. Right, so I think all these questions
2 are good. And I hate to throw out more questions than
3 answers here, but that's kind of my job.

4 So, you know, we want to do what makes the most
5 sense and what we have buy in from the marketplace on.
6 And so we want to develop some kind of consensus so
7 there's not just policy in a vacuum, so that it's
8 actually something that people can go out and do.

9 So, I think that kind of broad versus deep
10 question is maybe a way we can grapple with some of
11 these issues and give people some organizing principle
12 to come to the table and tell us what they know.

13 MR. ASHUCKIAN: Yeah, we do have a couple
14 comments here from the audience. Gina, could you come
15 up and give your comment and then followed by Mike.

16 And then if anybody else has comments about this
17 particular topic, just go ahead and come on up to the
18 mic after the next speaker.

19 MS. GOODHILL ROSEN: So, a quick comment, hi. I
20 think so, there's a green light. Can you hear me? It's
21 a pretty small room so you can hear me.

22 So, there will be more detailed comments in
23 written form. But, very briefly, I think there
24 definitely does need to be quantitative comments. I
25 don't think that we can really measure success unless we

1 know what we're aiming for. So, definitely, there
2 should be actual goals that we have in place for this
3 program.

4 There's a lot of great ideas, I think, that are
5 up here. One thing that we really have in the comments,
6 though, just in this last presentation that it was very
7 briefly mentioned, the scoping report, is that at the
8 end of the day the goal we pick needs to get us to our
9 AB 32 targets.

10 I think that that needs to be the overarching
11 point in choosing these targets is -- I mean, this isn't
12 a suggestion in terms of AB 32, it's something we have
13 to meet for our sector.

14 Global Green did some very, very rough
15 calculations on just these scenarios, which I know are
16 suggested, but even looking at these individual
17 scenarios if we were to just choose one, we're really
18 not anywhere close to meeting our goals.

19 So, I know these are incredibly aggressive but
20 unfortunately, or unfortunately, the goals for AB 32 are
21 incredibly aggressive, so I think that's something we
22 need to look at.

23 With that said, some of the things that are up
24 here seems like we're really looking at regulations.
25 And so, as we mentioned yesterday, I think we need to

1 put regulations at least on the table before 2015,
2 especially if we're looking at it in terms of meeting
3 our AB 32 targets.

4 It seems like we would be doing a disservice to
5 ourselves if we completely took it off the table and
6 didn't even consider it until 2015.

7 So, we'll have more details in our written
8 comments, but that's basically it.

9 MS. BROOK: So, Gina, could I just ask one
10 question, not to get into the weeds too much, but when
11 you say meet the AB 32 goals do you mean published
12 numbers for electricity and gas reductions from the
13 sector, the building sector, or do you mean 1990 levels
14 of greenhouse gas?

15 MS. GOODHILL ROSEN: No, I mean the first one.

16 MS. BROOK: Okay, thanks.

17 MR. ASHUCKIAN: After Mike we have Conrad Asper.

18 MR. KESSEE: Mike Kessee at SMUD, an engineering
19 question for you, Martha, how much PV does this
20 represent?

21 MS. BROOK: How much PV?

22 MR. KESSEE: Yeah, do you know how much PV is
23 represented in each scenario?

24 MS. BROOK: No, I don't. I could --

25 MR. KESSEE: Can you guess?

1 MS. BROOK: We could do the math but I can't do
2 it in my head so --

3 MR. KESSEE: Is it more than the Governor's 12
4 gigawatts?

5 COMMISSIONER MC ALLISTER: Also, though, I mean
6 this is energy -- this is electricity consumption,
7 right, so this is -- I mean so this is behind the meter,
8 whatever's behind the meter right, so it presumably has
9 some distributed PV and potentially some other stuff in
10 there. So it would be good to kind of maybe break that
11 out at some level.

12 MS. BROOK: Well, no, this is metered, right, so
13 this is what's measured, what's getting consumed in a
14 building.

15 COMMISSIONER MC ALLISTER: Yeah, but this is net
16 metered, right?

17 MS. BROOK: Yeah, it doesn't include -- it
18 doesn't count PV generation, it's what's expected to be
19 used.

20 COMMISSIONER MC ALLISTER: Okay, so this is net
21 consumption.

22 MS. BROOK: Yeah.

23 COMMISSIONER MC ALLISTER: This is what we
24 expect net consumption to be. So it actually, in
25 theory, captures the distributed PV, right.

1 But at the same time -- so this is in kilowatt
2 hours so this doesn't actually -- this isn't in carbon
3 so --

4 MS. BROOK: No, it's not and it's again --

5 COMMISSIONER MC ALLISTER: To Gina's point,
6 though, the RPS would actually make the carbon trend
7 continue to go down.

8 MS. BROOK: Yeah, so one of the challenges that
9 we have, as policy analysts, is data, right, and it's
10 harder to do this type of analysis with the type of gas
11 data that we have. So, we didn't combine it and put it
12 into Btu terms from the carbon perspective it was --
13 because it was just easier to look at the electricity
14 data.

15 MR. ASHUCKIAN: Actually, I was going to say we
16 have Becky Menten on the line if we want to give her a
17 chance.

18 COMMISSIONER MC ALLISTER: Hey Becky.

19 MS. BROOK: Hi Becky.

20 MS. MENTEN: Now can you hear me?

21 COMMISSIONER MC ALLISTER: Yes.

22 MS. MENTEN: Hello?

23 COMMISSIONER MC ALLISTER: Hello.

24 MS. BROOK: Hi Becky.

25 MS. MENTEN: Okay, great, hi guys.

1 COMMISSIONER MC ALLISTER: Hey Becky.

2 MS. MENTEN: So, I just wanted to take this
3 change, basically I wanted to echo what Gina said which
4 is that when we started to look at those projections and
5 consider how they compared against the AB 32 goals, back
6 to the question of broad versus deep we really couldn't
7 find either of those on its own got us to where we were
8 going.

9 So, I think it's not an either/or question, but
10 it's really a both question. And from my perspective
11 the takeaway is that you really just have to remember to
12 design the programs to serve the different market
13 sectors.

14 So, maybe some people, the earlier adopters, are
15 the right folks to drive towards zero net energy and
16 deeper, and maybe there's another program which reaches
17 a broader amount of people less deep. So, I just wanted
18 to share that perspective.

19 COMMISSIONER MC ALLISTER: Thanks a lot, Becky.
20 Yeah, I mean I totally agree. I think, yeah, I feel
21 like I'm in kind of a bind here because there are -- we
22 can throw everything at the wall and expend a lot of
23 resources, and we've got to really -- you know, at the
24 same time much of what we do is going to be mediated
25 through the PUC process, and go through the cost

1 effectiveness filters, and subject to some of the
2 limitations of program design, the data availability and
3 stuff like that. And so those are also real constraints
4 and so I'm not -- I'm definitely not making excuses
5 here, I mean we're going to try to do everything we
6 possibly can.

7 And, you know, I think all of us are totally
8 committed to that.

9 I agree, everything that works has to be on the
10 table. And, you know, so the -- you know, there are so
11 many stakeholders involved in this that I think, you
12 know, I don't want to prejudge what I think is going to
13 work and sort of put that on the table and drive the
14 conservation towards that. I think we need to people to
15 get there so we have buy-in, and so what we end up with
16 is something that's actually implementable.

17 And it's my sincere hope that we can get much of
18 the way there with things that we basically have
19 consensus on. And then if we're forced, you know, to
20 have the discussion, which I think will come, about what
21 regulatory hammers we're going to use to force some of
22 this additional savings into the marketplace, then we
23 have to have that discussion, too.

24 And I think it's all very relevant, you know, in
25 the near term to sort of start to put the pieces on the

1 table.

2 But we're the friend of this process, I very
3 much appreciate what Gina and Global Green are pushing
4 for and, you know, echoed by Becky. And yeah, I mean I
5 think that's the reason we're all here so thanks.

6 MR. ASPER: Hi, Conrad Asper of CBPCA. It
7 ultimately will be a question for you, Martha.

8 But I wanted to say it seems like the plug load
9 situation and how that's increasing is going to be
10 pretty significant. And that being the case it would
11 seem that the operational ratings really do make a huge
12 difference in trying to communicate to customers, you
13 know, what's going on, buy a power strip, that kind of
14 thing.

15 They may be simple fixes, but I think wouldn't
16 it be a better -- a good use of resources to kind of go
17 down and dirty on the asset ratings that the DOE maybe
18 has put together with the home energy score, like I
19 think you've been in conversations with them.

20 And, you know, put that aside and then really
21 focus our energies, and I'm sure we'll hear from some of
22 the folks today, on how we can have policies that will
23 really promote the operational ratings and getting
24 people to understand this.

25 MS. BROOK: Yeah, I mean my -- my opinion and I

1 think a lot of people share this opinion is that there's
2 value in both and for different reasons, and for
3 different opportunity points in a building lifecycle.
4 And so I agree completely, I think there's a ton of
5 value in looking at data and understanding people's
6 operational characteristics, and especially for those
7 consumer electronics.

8 MR. BAKER: Good morning everyone, Simon Baker,
9 the Public Utility Commission Energy Division. If you
10 could bring up the charts, that would be helpful for my
11 comments. The targets charts.

12 MS. BROOK: Like the Res. 1 for example.

13 MR. BAKER: Yeah, that will work.

14 MS. BROOK: The next one, yeah.

15 MR. BAKER: Thank you. So, I just wanted to
16 point out, so the green line there, the economic
17 potential, so that comes from the Public Utility
18 Commission's recent potential study. And I just want to
19 point out the not-so-good news that economic potential
20 is actually much larger than the utilities' goals.

21 MS. BROOK: Market, uh-hum.

22 MR. BAKER: Market potential I think is on the
23 order of 40 percent or something of economic potential.

24 So, actually, what the utilities' goals are is
25 much smaller than that.

1 MS. BROOK: Okay, good, I didn't know.

2 MR. BAKER: The economic potential represents
3 what the economic potential is using current cost-
4 effectiveness methodologies. And again, kind of back to
5 the discussion of yesterday and, you know, this
6 disconnect between current cost-effectiveness
7 methodologies and what even the Public Utility
8 Commission's own strategic plan goals suggest. I mean
9 you've got a line there, you know, the ZNE new homes
10 which hasn't been assessed for cost effectiveness. The
11 Commission, itself, you know, acknowledged that in its
12 strategic plan.

13 So, and to the point about, you know, these
14 wedges being yet still smaller than the AB 32 goals I
15 mean that's a very valid point. And I think we have to
16 think about this kind of over time as kind of a feedback
17 mechanism.

18 As the price of carbon starts feeding back into
19 the assessments of economic potential, then you're going
20 to start seeing that wedge of utility program economic
21 potential potentially getting bigger and bigger.

22 But there's also, you know, the political pinch
23 point, too, of how much the economy can take in terms of
24 the cost of carbon.

25 So, you know, the AB 758 legislation and the

1 apparently broad authority that it gives the Energy
2 Commission to adopt regulations, that seems like one of
3 the sort of key components to solving this problem, you
4 know, absent getting new legislation that provides some
5 additional flexibility on cost effectiveness, or
6 provides new funding sources.

7 You know, I'm just trying to think through this
8 and I'd be interested to hear from the Energy Commission
9 folks about the -- the breadth of the authority that
10 seems to be granted in the AB 758 legislation to address
11 this.

12 COMMISSIONER MC ALLISTER: Well, it does say
13 cost effective as well, right? Not necessarily to the
14 same definition that the PUC utilizes in the cost-
15 effective methodologies, but 758 does require that it be
16 cost effective in some way, right.

17 MS. BROOK: Uh-hum.

18 COMMISSIONER MC ALLISTER: So, we have to
19 grapple with that. And, obviously, resources that are
20 sort of outside of the IOU/PUC process potentially could
21 have -- could be more flexible for us to fill gaps or,
22 you know, do things to complement what's happening in
23 the utility sphere.

24 So, I guess, so those are all great points. And
25 so, yeah, I mean regulation is definitely on the table

1 for sure, no question about it. And that comes with all
2 sorts of, you know, social, economic, political issues
3 that we have to really think through and so we're going
4 to be doing that, absolutely.

5 I guess I wanted to -- I wanted to dig in a
6 little bit or just so people can understand it, maybe,
7 Martha ask you or Simon on the PUC economic potential.
8 The time horizons that we are seeing in these curves are
9 actually, for the most part, pretty near term. The
10 nearer term they are, the more based on actual data they
11 are, right.

12 So, you see a dip based on sort of current
13 technology, current cost-effective methodology, like I'm
14 referring to the green curve here --

15 MS. BROOK: Uh-hum.

16 COMMISSIONER MC ALLISTER: -- in the near term
17 up to 2018, 2020, and then you kind of have a linear
18 after that because you don't know what technology's
19 going to be out there. When you're designing actual
20 programs you have to work on actual technology.

21 MS. BROOK: Exactly so --

22 COMMISSIONER MC ALLISTER: You know, if we're
23 going to take a longer term view than that then we're
24 forced to kind of do modeling at a much more high level
25 and just make like assume technology in some abstract

1 way, and that isn't as useful for programs.

2 MS. BROOK: Right and that's basically what that
3 green line is doing. After 2016 it's just basically
4 saying that -- basically, there's this grand assumption
5 that there's the same amount of economic potential every
6 year after that and, basically, the same amount of
7 technical potential in 2016 every year forward, and
8 that's why it's basically a straight line.

9 COMMISSIONER MC ALLISTER: Yeah. Well, I mean
10 to Gina's point so if we're -- so we have this big
11 unknown of what technology's going to exist, what
12 advancements in lighting, or HVAC, or building shell, or
13 home area networks, or whatever. We don't know so it
14 makes it really quite hard to model, to know what the
15 potential is that we're -- you know, that pathway then
16 becomes kind of an open field instead of a road, right.

17 MS. BROOK: Uh-hum.

18 COMMISSIONER MC ALLISTER: So, anyway, I think
19 just so everybody appreciates kind of much unknown there
20 is here and how important it is that we kind of keep
21 engaged over the long term on these issues as things
22 change.

23 MS. BROOK: Right. And the other thing I would
24 mention, just from my perspective, is any time one of
25 those scenarios says 75 percent of the homes, so three-

1 quarters of the homes are going to take an action, I
2 would assert that there needs to be some mandatory
3 component to that program for that to reach that level
4 of adoption, basically. I mean that's just my assertion
5 but I think that's a good way to think about if you're
6 going to go to those levels and reach that type of an
7 impact, you probably can't do it with just voluntary
8 programs.

9 We've never historically experienced that type
10 of adoption in voluntary programs before.

11 MR. ASHUCKIAN: Okay, this will be our last
12 question.

13 MR. MC BRIDE: My name's Al McBride, I'm the
14 Founder and Owner of Smart Light Systems and I make
15 products to help energy consumption, especially
16 fluorescent lights, especially for the retrofit market.
17 So, I make products that are specifically designed for
18 the retrofit market in buildings.

19 And I had a couple of comments. I think to
20 achieve these goals on the lighting phase, I believe
21 that's the green line --

22 MS. BROOK: On the commercial scenario it's on
23 the --

24 MR. MC BRIDE: On the commercial, I'm in the
25 commercial space.

1 MS. BROOK: Yeah.

2 MR. MC BRIDE: But that's very achievable. In
3 fact, all the customers we install for we achieve
4 greater than 50 percent energy savings on their
5 lighting, okay, so that's very achievable.

6 The main problem is I've never been in an
7 existing building that knew -- we do dimming of
8 fluorescent lights coupled with motion occupancy
9 sensors, and those two can give us easily over 50
10 percent.

11 But I have never been in a building, a customer
12 that knew they could do that, that they could dim their
13 fluorescent lights. So, I'm going to tell you that
14 getting the knowledge out, I think you're going to talk
15 about that later, perhaps, but getting that word out
16 either -- and how do you do that and what are your
17 levers?

18 One of them might -- obviously, the customers
19 that I deal with really look at the rate structure,
20 that's for sure. And the other thing they look at is if
21 it's an economic investment for them with an ROI of less
22 than two years, three at the max, the maximum.

23 So, unless you have low-cost products, which is
24 what I provide, about \$100 a fixture is what -- when we
25 install our units, you're probably going to have a

1 problem of penetrating as fast as that green line shows
2 in four years because it's -- I have not seen one
3 building that had what I offer installed at all.

4 And I do agree that the potential is huge. We
5 estimate there's 100 million fluorescent fixtures in
6 commercial in California, alone, let alone across the
7 country. So, I think this is a very achievable thing in
8 the lighting space, it's just a matter of getting the
9 word out that that exists and having low enough cost
10 products.

11 COMMISSIONER MC ALLISTER: Great, thanks very
12 much. And just a note, you know, we do have authority
13 on the appliance standards in Title 20 to develop
14 standards for lighting products. We're looking at some
15 quality standards, now, for LEDs which, you know, are at
16 the front end.

17 You know, we've seen, at least in the
18 residential markets, in screw-in compact fluorescents
19 and things like that, we've learned a lot from the
20 penetration of those over the last 15 years.

21 And as the marketplace moved towards LEDs, the
22 opportunities are huge for both quality and
23 fluorescents, absolutely. That's the existing stock for
24 the most part.

25 But there are a lot of technologies coming on

1 line that are just now, you know, sort of reaching
2 market -- the important levels of market penetration and
3 technology quality.

4 So, how we can manage the penetration and sort
5 of reinforce it and help it grow is, I think, a key
6 question.

7 MR. ASHUCKIAN: Okay, we have a presentation now
8 with the Department of Energy.

9 MS. COLLOPY: We have Cody Taylor from the
10 Department of Energy. We're just tossing the WebEx to
11 you, Cody, and then you're going to need to share your
12 desktop with us.

13 MS. BROOK: So, just for context, Cody was
14 invited to talk about the Buildings Performance
15 Database. That's part of our data panel that we're
16 going to spend the rest of the morning talking about.
17 And so Cody's going to introduce what the Department of
18 Energy's been doing in this data space and how we might
19 be able to take advantage of it.

20 MS. COLLOPY: And, Cody, we can see your
21 desktop, but if you can just blow that up to one slide?

22 It looks like you may have a split desk top on,
23 but if you can just put one slide showing that might
24 make it larger. Great, thank you, Cody. And we can now
25 see, if you want to go ahead and -- you can go ahead and

1 start.

2 MR. ASHUCKIAN: We don't seem to have your
3 audio.

4 MR. TAYLOR: And can you hear me now?

5 MS. COLLOPY: Yes, we can. Thanks Cody.

6 MR. TAYLOR: Perfect, there we go. All right,
7 thank you for this opportunity to join you virtually
8 today from Washington, where I'm sure the weather is not
9 as nice as it is in California, ever.

10 (Laughter)

11 MR. TAYLOR: I'm going to talk a little bit
12 today about an effort that we've undertaken here at the
13 Department of Energy, that we've called Buildings
14 Performance Database.

15 And so a little bit of background to add onto
16 what Martha said, my name is Cody Taylor. I work in the
17 Building Technologies Program here at the Department.
18 And I work primarily with commercial buildings, but this
19 effort we're talking about pertains both to commercial
20 and residential facilities.

21 So, I just want to put this in the context of a
22 couple of other of our initiatives here. The Buildings
23 Performance Database is noted there in the center, at
24 the top, but it's really one of a couple things that
25 we're doing here around energy efficiency data.

1 And the first of those is an effort to move the
2 country toward some agreement on a data taxonomy, which
3 you can see at left there. And this is something that
4 we've noted has been a real challenge for people across
5 the industry; it can really hamper information sharing
6 and comparability to the programs.

7 For example, two similar energy efficiency
8 programs run in neighboring states may be hard to
9 compare to each to understand whether one approach is
10 working better or worse than another, simply because the
11 data may be recorded in ways that are incompatible or
12 barely compatible, making it challenging to impossible
13 to make that kind of useful comparison.

14 And so that taxonomy effort is one piece.

15 The DOE Buildings Performance Database that I'll
16 be talking mostly about today is built on a taxonomy
17 that we've developed internally, based on looking at a
18 number of different databases out there, probably about
19 40 different data sources that we examined in trying to
20 build a sort of rational, hierarchical taxonomy that
21 I'll show you an overview of in a moment, of the kinds
22 of data that are relevant for building energy
23 performance.

24 The second thread for us is down at the bottom
25 there, what we're calling the SEED platform, or Standard

1 Energy Efficiency Data platform. And that is something
2 that is, again, built on that same taxonomy. But rather
3 than being centrally held at the Department, it's
4 something that we plan to make available as open source
5 software for cities, and states, and other jurisdictions
6 to use in managing energy data.

7 It's really a complement to the Portfolio
8 Manager Tool, in particular, that is managed by the EPA
9 for use with commercial buildings.

10 And our first -- our first use case there is
11 definitely the jurisdiction that has our benchmarking
12 and disclosure laws. In California, obviously, the
13 State does, I believe it's through AB 1103, and then
14 also the City of San Francisco does, and we've been
15 working closely with them as a beta tester of the SEED
16 platform.

17 So, really, the overall vision here at the
18 Department is that as we move toward a place where there
19 is some agreement on common data definitions and that we
20 use those in our data tools internally, at the
21 Department, and that others hopefully use the same
22 definitions and the same terms for building energy
23 performance data.

24 And, finally, we think the role of the solutions
25 that we're developing at DOE is really just to be the

1 underlying foundation and to demonstrate some of the
2 analytical power of building energy performance data.
3 But that, really, the true innovation there is going to
4 come from the marketplace and from third-party tools,
5 not tools that we develop internally.

6 And so we want to make sure that we're enabling
7 that in the long term. So, that's our overt thinking
8 here.

9 Now, to delve into the Buildings Performance
10 Database and what it is, and what we're doing, it is a
11 decision-support tool that is intended to enable
12 analysis of energy efficiency upgrades, primarily,
13 although there are other kinds of relevant analyses that
14 it can also assist with.

15 And it contains information about both the
16 physical characteristics of the buildings, their
17 operational characteristics, and the energy uses for
18 those buildings. And that's, really, the key point here
19 is it's the description of the buildings, as well as how
20 much energy is used by a building.

21 And its purpose is to enable statistical
22 analysis while maintaining privacy about information for
23 individual buildings. So, think about it as a data lock
24 at this point, where data that's contributed is
25 anonymous after it goes in, but it creates this data

1 store that is valuable for many different parties to use
2 for analysis. And you can think of the CBECS data,
3 which is collected by the Energy Information
4 Administration nationally as sort of an analog. That's
5 a little bit different because it's intended to be a
6 statistically relevant, a statistically descriptive
7 sample, nationally, of buildings.

8 Whereas, the Buildings Performance Database is
9 pulling from a variety of sources without that
10 constraint that they be as strictly statistically
11 representative.

12 But they both have that similar characteristic
13 that as data goes into them, the privacy of the
14 individual building is maintained.

15 So, as we bring in data, the final step is that
16 we are working with National Labs to cleanse and
17 validate data from different sources, translated into
18 that standard taxonomy I mentioned, so that it can all
19 be put in one place and trusted at the end.

20 But to give you a quick couple screen shots of
21 what this looks like, that I'm describing, you're
22 looking right now at our prototype tool for energy and
23 financial analysis.

24 And so you can see on the left, first selecting
25 a location, so imagine that you're considering right now

1 a retrofit to a particular type of building, so the --
2 in this example we're going to look at a single-family
3 retrofit. So, you might first select a location for
4 relevant comparator buildings, so if you wanted to say
5 show me buildings in a particular climate zone that I'm
6 going to consider retrofit in.

7 And then on the right side selecting particular
8 characteristics, so this is selecting single-family
9 homes. And a specific heating fuel, a specific age, or
10 year of construction, specific heating system type.
11 There are a number of criteria that you can use to down-
12 select, which narrows the number of records or
13 comparator buildings in the population that you're
14 looking at, and you can see -- I'm not sure if it shows
15 up on your end, the resolution of the projector there,
16 but there's a little blue box in the upper right-hand
17 corner of these screen shots that shows the number of
18 records that's being included.

19 And as you down-select by using more specific
20 filtering criteria that number will get smaller to
21 reflect the number of buildings that meet your criteria.

22 So, as one continues to specify an analysis, the
23 number of records will get smaller and smaller.

24 Now, the purpose here is to enable thinking, at
25 the portfolio level, about the impact of various

1 retrofits. And knowing that actual results in the real
2 world are noisy and reflect lots of differences in
3 buildings that we cannot always, necessarily, predict
4 the purpose here is to use large volumes of empirical
5 data on building energy performance to supplement and
6 inform decision making around energy efficiency
7 retrofits, and perhaps offer some different evidence
8 that we can access through only physical modeling of
9 buildings.

10 So, if this model can give you one single point
11 estimate of installing X widget is likely to save you
12 five kilowatt hours, but it usually does not give you a
13 very good sense of the performance risk distribution
14 around that point estimate of energy savings.

15 And that's what we're trying to enable here.
16 Again, with empirical data it's allowing someone to look
17 at the buildings that are out there, compare buildings
18 that have a low efficiency version of a particular
19 widget to buildings that have a high efficiency version
20 of that widget, and look at the delta between those two
21 populations to understand what -- what the difference is
22 in real life, in real buildings, accounting for the fact
23 that, again, the data's messy because there are a lot of
24 differences in the ways that we use our buildings and
25 the peculiarities from one to the next.

1 So, bringing that back to the specific example
2 here, you can see on the left side of these two screen
3 shots there are a set of green buildings which are post-
4 retrofit, and blue buildings which are pre-retrofit, so
5 think of that pre-retrofit as the low efficiency widget
6 and post-retrofit are green buildings as the high
7 efficiency widget, and the -- that is further on the
8 left of that scale of energy usage, which means lower
9 energy usage. In this case we're looking just at
10 natural gas because this is a natural gas furnace
11 retrofit, again, that we are considering in the
12 residential building.

13 And in red, at the bottom, you're essentially
14 seeing the distribution of energy savings from those --
15 comparing those two datasets. So, 95 buildings in this
16 case that have the low efficiency furnace and 23
17 buildings that have the high efficiency furnace and so
18 you can see -- again, that's not a very large number of
19 records, of course, but this gives you a sense of the
20 mean savings is X Btus and here's the standard deviation
21 in terms of what the spread can look like of the savings
22 you might see.

23 On the right side you see just a sketch of cash
24 flow analysis and the pink at the end there is the 90
25 percent confidence interval based on the data that is

1 being left. So, it's no longer, again, just a point
2 estimate.

3 And this is just a second example on the
4 commercial side. The primary thing I'll draw your
5 attention to here is that the analysis from the ones,
6 first, on the left, this is for differences in windows,
7 so single-paned versus double-paned windows, a very
8 simple difference in buildings.

9 First on the left, including both outbuildings
10 with operable and inoperable windows, and then on the
11 second time on the right showing only those buildings
12 with inoperable windows, that is where the windows
13 cannot be opened.

14 And so that gives you a smaller number of
15 records and the main arrow, the spread of the data that
16 you can see in terms of the calculated energy difference
17 between the single-paned building and the double-paned
18 building.

19 So, again, there are some other kinds of
20 analysis that you might run if you were looking at data
21 like this in the Buildings Performance Database.

22 So, I'm going to zoom back out after that
23 example, up to talking a little bit about the data
24 taxonomy that underlies this that we developed.

25 So, you can see the highest level sketch of it

1 here. And, really, we've tried to, as I mentioned
2 earlier, create something that gives us a rational
3 framework to fit in various descriptors for building
4 energy usage.

5 We know there are other things out there and we
6 will be working with stakeholders, beginning in the next
7 couple months, and extending for a number of months
8 after that to try to bring the energy efficiency
9 industry together to discuss what makes sense to all of
10 us in terms of a nationally appropriate data taxonomy
11 that multiple parties can get behind and implant in
12 their organization across -- across energy efficiency
13 programs to ensure that we are speaking the same
14 language and can equally translate our results to each
15 other.

16 The detail level of this taxonomy is that it
17 will prioritize the fields. There are about a hundred
18 fields for those what we call priority one data that is
19 the most important descriptors for buildings.

20 And then we have priority two and supplementary
21 fields, obviously, of increasing importance, but still
22 potentially meaningful in describing building energy
23 systems and energy usage.

24 So, I want to also mention the relationship of
25 the Buildings Performance Database to a couple of

1 other -- a couple of other initiatives out there.

2 So, one obvious one is Portfolio Manager, which
3 many people are aware of in the commercial space.

4 Again, it's maintained by the Environmental Protection
5 Agency. And the data that goes into that is essentially
6 operational characteristics of the building, a basic
7 description and its monthly utility bills.

8 And so that allows you to assess a building, how
9 a building compares to the CBECS population of buildings
10 and so it gives you a comparison to a national sample.
11 It doesn't necessarily give you a deep comparison in one
12 particular location simply due to the limitations of the
13 CBECS dataset that underlies it, but it can be an
14 excellent and helpful benchmarking tool.

15 It doesn't, I should mention, go into the asset
16 side of buildings really at all. And I know that
17 there's been a little other discussion of asset ratings.

18 So, our last row here in this sample is a couple
19 different asset ratings. And so the key data input
20 there of course are the asset characteristics of the
21 building.

22 And the type of analysis that allows is some
23 understanding of the efficiency of energy systems in a
24 building. Now, the Buildings Performance Database is
25 meant to take both kinds of data here, both the

1 operational and asset data, as well as the energy usage
2 data and allow -- allow large type analyses.

3 So, these may be analyses of similar types to
4 those -- for example, a benchmarking analysis could be
5 done similar to the kind of benchmarking in the
6 Portfolio Manager. It might not, again, have strict
7 connotation of being a nationally representative set of
8 buildings, but in some cases the Buildings Performance
9 Database may allow you to have a dataset where you don't
10 have a comparator dataset really at all now.

11 So, I think for example some of the
12 miscellaneous buildings that Martha was just mentioning
13 earlier, for which we don't have large numbers collected
14 in the CBECS survey to give you a good comparison.

15 But if a state was able to collect, say, a
16 hundred fire stations' or police stations' energy
17 characteristics then, suddenly, you start to have a
18 decent comparator set which may be better than nothing
19 in terms of giving you some basic benchmarking.

20 That's a kind of feature that the Buildings
21 Performance Database can support.

22 So, we think there's value in this to a number
23 of different entities. I'm not going to run through
24 these in detail today. I believe the slides will be
25 made available and I don't want to dwell on this too

1 much.

2 We think it is potentially available -- pardon
3 me, potentially of value to financial institutions,
4 those at the project investment level in particular, and
5 who want to think about retrofit performance.

6 And to the extent that that may impact the
7 financial performance level, alone, they may want to
8 know what empirically is likely to be the performance of
9 a particular retrofit before they're willing to make a
10 loan that is primarily to execute that kind of retrofit.

11 And similarly, building owners and managers may
12 wish to use something like the Buildings Performance
13 Database to assess opportunities for energy efficiency
14 investment, understand performance risk of various
15 investments.

16 Government agencies have the same interest for
17 their own buildings, so as they're property owners they,
18 of course, want to assess returns that are likely from
19 various investments.

20 Of course, it also may be something the
21 government agencies wish to use in influencing local
22 real estate markets. So, by making statistical
23 information available that can, as was suggested
24 earlier, increase the ability to benchmark certain
25 building types, for example, that you might not have

1 otherwise to make.

2 So, we think this can be a tool that enables
3 that by providing a repository, again, for anonymously
4 holding the kind of data that can allow someone to look
5 up the statistics on a particular building type.

6 And now for energy efficiency program
7 administrators we also see some values there. One may,
8 in helping to assess opportunities and target the
9 program design, really.

10 In other words understanding -- if there's an
11 empirical basis for saying, well, this retrofit type
12 appears to be under-performing in this subset of a
13 building type and over-performing in another subset of a
14 building type, then that may be a basis for changing the
15 way a program is targeting who it markets to or where it
16 intends to spend most of its incentive dollars.

17 And there may also be a value of the kind of
18 approach I'm describing in terms of this -- we're
19 calling it actuarial analysis around here, in terms of
20 supporting EM&V on the backside of programs. So that
21 you might actually be able to, in the future, use this
22 to enhance or -- enhance the EM&V that's being done or
23 potentially lower the cost of executing the EM&V by
24 bringing in other statistical information that is
25 available in the state with respect to energy efficiency

1 programs, but may not be the approach undertaken right
2 now in program evaluation.

3 So, I'm not -- I'm not trying to promise that
4 we'll turn this on tomorrow and you'll drop \$10 million
5 off your EM&V bill for the State of California, but I
6 think this is something that we should look forward to
7 as a potential in the future and consider what the
8 methods need to be -- what methods need to be developed
9 to enable bringing this kind of data to bear to reduce
10 costs and approve the usability of outputs of EM&V
11 activities.

12 Currently, the data in the database, that you
13 saw, is about 50,000 buildings from both public and
14 private datasets. You can see some of the contributors
15 here of various types.

16 I'll note that CEC is on this list and has
17 assisted by making the CVEUS data, the California
18 Virtual End Use Survey data available to include in
19 here, so that gives us one good source. There are
20 several others.

21 Obviously, many of these are regionally
22 specific, although not all of them are. And some of
23 them are specific to particular building types, although
24 not all of them are.

25 We really think that inclusion of data in the

1 database is the biggest thing that differentiates
2 whether it's useful and not useful. And so as we
3 started this project, you know, we built the underlying
4 infrastructure and we built a couple of prototype tools.
5 You saw some screen shots of examples from that earlier.
6 And we've been building up the dataset.

7 That will be ongoing, continuing to build that
8 dataset is really a priority of ours and something that
9 we are actively looking around to understand where
10 appropriate datasets are that can flesh this -- because
11 the richer and broader that dataset is, the more useful
12 it can be for different kinds of analysis.

13 So, to give you some sense of what the data
14 looks like that is going in there, here's just a quick
15 snapshot of the types of data. So, in the basic
16 building descriptions are things like the location, what
17 type of building it is, whether that's a retail, or a
18 hospital, or something else, what's the size of the
19 building, the age of the building and the utility usage
20 for at least one year.

21 And where we have some records in there that
22 have annual data, some records that have monthly data,
23 some records that have interval data. Obviously, the
24 more granular the data is, the more types of analysis
25 and more detail it can be put to in terms of its use for

1 output.

2 Now, on the right side you can see detailed
3 building characteristics that we have going in there, as
4 well. So there are -- that's all of the equipment
5 information, lighting type, and efficiency controls
6 present, various other descriptors about HVAC systems,
7 water, shell. And then, finally, operational
8 characteristics. Again, this is the type of information
9 that is typically, at least on the commercial side, put
10 into the Portfolio Manager Tool that can give you some
11 sense of how those assets are actually used.

12 The last thing I'll mention on this is about our
13 concern with privacy and security for the data. So, we
14 are absolutely sensitive to the fact that this is data
15 that most folks do not want to have out on the street in
16 its raw form.

17 And so I want to be very clear that the data
18 that goes into the Buildings Performance Database today
19 is not something that, you know, that when we develop
20 public access and a publicly available ACI it's not
21 something where anyone has access to the raw data to be
22 able to say, you know, the building at 123 Main Street
23 is using this much energy in this month, or anything
24 like that.

25 Yeah, so the identity of an individual building

1 is going to remain private once its data is in here.

2 However, we're trying to ensure that we can do
3 that and also offer large-scale analysis.

4 So, the data's in there, it's anonymous. We've
5 taken pains to scrub and cleanse to ensure its anonymity
6 and to ensure anonymity structurally through the way the
7 tools are accessed.

8 I didn't show this earlier, but if anyone tries
9 to cut down to a -- or pardon me, filter down to
10 something so specific that it gives too small a number
11 of buildings that will simply return an error that says
12 you've used too precise a filter, and you'll receive too
13 few buildings and, therefore, we don't show a result.

14 So that prevents somebody from, for example,
15 narrowing down to a single specific zip code and saying,
16 you know, show me data for hospitals in that zip code
17 and knowing there's only one. It prevents someone
18 getting back data for a single hospital through that
19 mechanism, or otherwise for a particular building.

20 So, I think in sum we've taken a lot of care
21 there and feel good about the security measures that we
22 have in place, and we think that's something that might
23 help to ensure that folks feel confident in contributing
24 data to this.

25 And so, finally, the overview of that

1 contribution is essentially just to let us know that
2 you're interested, work with our National Lab to help
3 identify and evaluate your datasets, and work with us on
4 the privacy side to make sure you understand how our
5 privacy protections work.

6 And then the National Lab will work with you and
7 with us to cleanse and validate the data, and make sure
8 that we in fact understand the terms and the definitions
9 you're using, and then import it into our database where
10 it can then be accessed.

11 So, I will stop there. I'm happy to take any
12 questions or comments. It's something that we've been
13 working on for a while and I think that it is relevant
14 to some of the work that California's considering.

15 And we would certainly welcome collaboration on
16 this. And we'd be happy to share whatever we can to
17 make your efforts go easily and more smoothly.

18 And we would, of course, also be happy for any
19 data that you're able to contribute that can make this
20 resource more useful to anyone, especially those in
21 California.

22 MS. BROOK: Great. Thank you, Cody, very much.

23 This is Martha, I just wanted to -- just if you
24 could clarify how interested parties might be able to
25 participate in your data taxonomy discussions that you

1 said were going to be initiated soon and ongoing for
2 several months, I think that might be a great first step
3 for us to think about. I mean just assuming that it
4 will take longer to make decisions about whether there's
5 future contributions or --

6 MR. TAYLOR: I can't hear anything, is everyone
7 on mute?

8 MS. BROOK: Oh, well, you can't hear me so why
9 should I tell you?

10 (Laughter)

11 MS. BROOK: Cody, we're trying to get it fixed
12 so you can hear us.

13 MR. TAYLOR: There we go, now I can hear you,
14 Martha.

15 MS. BROOK: Okay. So what I asked you, when you
16 couldn't hear me, was if you could explain briefly how
17 interested parties could participate in your data
18 taxonomy discussions going forward.

19 Under the assumption that it might be easier for
20 us to at least agree that we ought to organize our data
21 in a common way before we're able and willing to share
22 all data, it would be great for us to participate in
23 your discussions.

24 MR. TAYLOR: Sure, so we're absolutely
25 interested in folks who would like to participate in

1 that discussion. And as I mentioned, we haven't begun
2 that, yet. I think the easiest way is basically just to
3 reach out to me or to Elena, both of our contact
4 information is here on this slide and we're the two
5 primary contacts at DOE for both the Buildings
6 Performance Database and the Taxonomy Development
7 Initiative.

8 And I definitely want California involved in
9 that. I should also note that it's not necessary to
10 wait for total agreement on data taxonomy nationwide to
11 begin contributing data into the BPD. And I fully
12 expect that it will be a long process before we get
13 everyone on the same page around taxonomy.

14 MS. BROOK: Okay, great. Thanks.

15 MR. ASHUCKIAN: So, we are just about out of --
16 basically out of time for this panel, for this
17 presentation. And Andrew, Commissioner McAllister, if
18 you have any questions or comments you want to make
19 but --

20 COMMISSIONER MC ALLISTER: No, I just wanted to
21 thank Cody and the Department for being with us today,
22 and really helpful stuff. And I know the staff and you
23 are in close contact on this.

24 And I've been in touch with some folks earlier
25 about this, as well, and really think it's a great

1 resource that we can leverage and contribute to.

2 I'm sure there are lots of, you know, details
3 about sort of, you know, California and the nation, and
4 getting all that coordinated.

5 And also, you know, I think the issues of data,
6 you know, setting it up such that there's a high level
7 of comfort of providing data to inform a database is
8 really, really important, and then making sure that it
9 is searchable in ways that are useful at a fairly
10 granular level, so that we know that we're using data
11 that's relevant for the particular case.

12 And so I think probably those discussions are
13 ongoing with staff and are extremely important for
14 making it relevant, you know, across the country.

15 So, thanks again, really, for making time to be
16 here with us.

17 MR. ASHUCKIAN: Now, there was a few questions
18 from WebEx to Cody, and if those could be handled
19 electronically, and then those questions or answers
20 getting back as comments to us, that would be very
21 helpful.

22 And so with that, I think we'll bring this --

23 MR. TAYLOR: I'm happy to do that.

24 MR. ASHUCKIAN: Great, thanks.

25 We'll bring this session to a close and let's

1 take a short break, and let's be planning on being back
2 in your seats, ready for the first panel at 10:45.

3 (Off the record at 10:36 a.m.)

4 (Reconvene at 10:46 a.m.)

5 MR. ASHUCKIAN: Okay, this panel's going to be
6 on data. And before we start, actually, I have an
7 announcement from the PUC. The PUC is going to be
8 hosting a workshop on -- it's actually a two-day
9 workshop this Thursday and Friday on data privacy
10 issues, and it will be in the Commission's Golden Gate
11 Room from 9:30 to 3:00 p.m.

12 So, you can take a look at their website for
13 more information on that.

14 So, with that I'll go ahead and turn it over to
15 Martha.

16 MS. BROOK: Hi, thanks for coming back from the
17 break.

18 And our first formal panel for today is on data
19 and we've been kind of queuing up this panel for the
20 last day. We kind of forecasted it yesterday and we
21 have many people who came back today to talk about data,
22 so we appreciate that very much.

23 I'm not going to spend any more time introducing
24 the session. I think we all know what we want to talk
25 about and we're going to let our panelists drive this

1 session.

2 So, just to reiterate the organization of the
3 panel, each of these panelists will, in seven minutes,
4 introduce themselves and put them -- explain to us why
5 we've invited them here and also ask them to -- are we
6 going to get the questions that we -- we have the --
7 okay, so Dave's going to get the questions up there and
8 then they're all going to respond to one, two or more
9 questions in that seven-minute period.

10 So, first up we have Mimi Frusha. And she just
11 told me her last name and I already screwed it up, so I
12 apologize for that.

13 Mimi co-founded Renewable Funding in 2008 with
14 the mission to develop innovative finance and technology
15 solutions designed to transform the clean energy
16 industry.

17 Ms. Frusha is responsible for the implementation
18 and execution of Renewable Funding's PACE finance and
19 technology contracts, and programs for clients across
20 the nation.

21 Since the launch of Energy Upgrade California
22 Renewable Funding has been responsible for the
23 development and maintenance of the UEC web portal, as
24 well as the data collection reporting efforts for the
25 Energy Commission, L.A. County, and the Better Buildings

1 Program Pilots.

2 Mimi.

3 MS. FRUSHA: Good morning all, thank you for
4 having me here today and thank you to the Commission for
5 putting on this workshop.

6 Just before I hit on my questions I thought it
7 would be helpful to give a little bit more background on
8 what we are doing on data for the Commission.

9 Renewable Funding, following the end of the
10 statewide SEPT contracts was contracted by the Energy
11 Commission, ultimately, to develop what we're calling
12 the Energy Upgrade California Data Warehouse, or the EUC
13 Data Warehouse, to support its EM&V efforts.

14 What's unique about this data warehouse is it's
15 the first effort to aggregate data from multiple
16 sources, IOUs, HERS providers and local governments into
17 one comprehensive dataset, and it would include
18 information about single-family, ratings assessments and
19 projects.

20 The data, itself, will allow us to answer
21 questions about incentives and financings, building
22 characteristics, pre- and post-retrofit, as well as
23 measures that were installed, project milestone,
24 contractor characteristics and job statistics.

25 So, I think the data will provide some rich

1 information that we have yet been able to marry.

2 To date we've hit a number of milestones. We've
3 negotiated a number NDAs, and confidentiality
4 agreements, both with local governments, the Commission,
5 as well as the IOUs.

6 We have received data from nine local
7 governments, representing 15 different programs, and
8 have received 2,000 records from PG&E. And to date we
9 have a master project list of 10,000 projects, so when
10 you look at what the Building Performance Database has
11 of 50,000, we have a significant amount of residential
12 energy efficiency data. Not all of those are projects
13 completed, but include assessment and project
14 information.

15 I think the effort that we have embarked upon
16 ultimately can serve as a platform for other efforts
17 that are going on across the State with AB 758, with the
18 CPUC Energy Efficiency Portfolio, particularly related
19 to financing, as well as the Energy Data Center that
20 just opened.

21 That said, what we have done with Energy Upgrade
22 California Data Warehouse to date is just a portion of
23 what we need to be doing. I think there are a number of
24 elements that are still missing and this is an
25 opportunity to put it on the record and get all of our

1 political and regulatory will behind moving things
2 forward.

3 A couple of things we have not gotten is we
4 haven't gotten data from the remaining three IOUs.

5 We do not have public access protocols defined
6 because it is a negotiation between the multiple
7 stakeholders that are providing this data.

8 The future use of the warehouse has not been
9 defined. I think there's opportunities to leverage it.

10 And lastly, ongoing collection of data has not
11 been defined. And right now we have a snapshot of data
12 for a certain amount of time, but we don't have ongoing
13 data.

14 Some things that would be terrific to be able to
15 collect is energy usage data, which this data does not
16 contain. It is just retrofit and assessment data at
17 this point in time.

18 So, with that background in mind I think we, as
19 an industry, really could benefit from something like
20 the CSI database. I think we see what that has done for
21 the solar market and we need something similar in the
22 energy efficiency industry.

23 So, the question is -- thank you, question 19,
24 "What can be learned from the California Solar
25 Initiative Online Database experience that can be

1 extended to energy efficiency upgrades?"

2 I think probably one of the most important
3 things about the CSI database, that I see when I look at
4 it, is how it came to fruition and the genesis of it. I
5 think, actually, the decision by the Commission --
6 Public Utilities Commission in August of 2006 really set
7 the stage for CSI and actually what CSI has been able to
8 do, the CSI database has been able to do.

9 And then, ultimately, the decision mandated two
10 things, that there was centralization and access. And
11 those are two things right now, with energy efficiency
12 data, we do not have centralization, although we have
13 been undergoing that effort to do it.

14 And the second is we don't have really clear
15 access. And I think what was laid out in that decision,
16 in 2006, really enabled a powerful dataset for the
17 industry that has allowed them transparency into the
18 market. It has allowed key business decisions to be
19 made, investments, private investments into the sector
20 to be made and, ultimately, marketing strategies.

21 And I think the energy efficiency sector is
22 really lacking in that respect, we don't have that
23 comprehensive dataset that can be accessed easily and
24 publicly.

25 EUC, at its genesis, did envision being like

1 CSI. I think we had wanted to have a centralized
2 application process and bring all the data into one
3 place. Ultimately, what happened was we were all
4 running around trying to implement our programs and I
5 would say the regulatory, the political, and maybe just
6 the time were not -- the will and the time were not
7 there.

8 And I think we are at an opportunity to do
9 something much more like CSI.

10 So, with that in mind I'll move to some of the
11 question 22, which is, "What actions exist to collect
12 pertinent energy savings and market characterization
13 data without collecting personal and business sensitive
14 data?"

15 I will say with EUC, if we would have not gotten
16 any PII, or personally identifiable information from the
17 various sources there would have been no way to match
18 all of this data and create one master list or a unique
19 record when there were multiple records, or multiple
20 sources of information for a project.

21 So, the reality is you need PII for whoever is
22 that database administrator. But it's not about what
23 you collect, but how you display it. And I think at the
24 end of the day what's really important is that whoever
25 is receiving that data, validating that data, QA'ing

1 that data is then how they make it publicly available is
2 very clearly specified and defined.

3 And I think some of the things that Cody was
4 saying about the Building Performance Database are
5 perfect elements. So that you can't allow someone to
6 drill down to a zip code such that they can find a
7 property, one unique property. You have to put
8 constraints and limitations on how that data is
9 displayed.

10 And I think the perfect example, the IRS
11 collects the most sensitive data about all of us, and
12 they actually display tax stats, but we know they're not
13 going to display our personal information.

14 And so I think we sit here and sometimes hem and
15 haw and I think our utility partners are oftentimes
16 constrained, or their lawyers are constrained about how
17 they interpret the law, but the reality is we have to
18 protect the individual, but we can still make data
19 available publicly.

20 One of the thoughts, just as we think about
21 collecting personal information and then displaying
22 information that is anonymous or at an aggregate level
23 is we really should think about at what geographic unit
24 we display it in. Because one of the things that's
25 really important is can we start to marry some of this

1 data about projects with valuable demographic data?

2 And so I think as you look at Census Bureau Data
3 and think about how the Census Bureau can -- or
4 aggregates that data and displays that data might be
5 something that we might want to look at, using similar
6 geographic units, as long as we're protecting the
7 individual's information.

8 So, with those comments I think I'll just sum,
9 is the EUC Data Warehouse we've learned a lot, we can
10 inform a lot of the decisions that are going forward and
11 we're happy to participate and offer our insights.

12 I think it's paramount and critical that we
13 centralize and standardize our data but, and this is
14 sort of the theme of yesterday, not putting undue burden
15 on contractors and consumers.

16 I think as we talk about broad versus deep
17 there's lots of different data that's collected and we
18 have to be really thoughtful about how we're getting
19 that data from contractors and aggregating that data, or
20 consumers and aggregating that data.

21 Because at the end of the day, with Energy
22 Upgrade California one of the challenges has been lots
23 of detailed data that the quality of it has been
24 challenging, and even the ability of the collect it has
25 been challenging.

1 And then last I would say we should leverage our
2 political and regulatory will of those in this room. I
3 think the CPUC and the Energy Commission have an
4 excellent opportunity here to really set the stage for
5 how data is made available going forward.

6 And I think looking to the CSI ruling in 2006 is
7 a perfect example.

8 So, thank you very much.

9 MS. BROOK: Great, thank you, Mimi.

10 Next we have David Jacot. And David is a
11 professional engineer and the Director of Energy
12 Efficiency for the Los Angeles Department of Water and
13 Power. David has a bachelor's degree in mechanical
14 engineering, yay, from the University of Oklahoma --

15 (Laughter)

16 MS. BROOK: -- and a master's degree in urban
17 and regional planning from California Poly Tech
18 University, Pomona, as well as over 15 years of
19 experience designing high-performance building systems,
20 modeling building energy performance, and managing
21 energy efficiency programs.

22 David.

23 MR. JACOT: Great, thanks Martha. So, as a
24 disclaimer, I'm with LADWP now, as the Director of
25 Energy Efficiency, but I've only been with LADWP for

1 about four months. I was with Edison, Southern
2 California Edison for ten years' prior.

3 So, the experience I'll be talking about here
4 that I've gained to answer these questions, is largely
5 from my Edison experience. The disclaimer is that, you
6 know, the thoughts, and sentiments, and other things
7 that I voice are not necessarily the position, the
8 official position of either Edison or LADWP.

9 (Laughter)

10 MR. JACOT: This is just me, speaking from my
11 experience.

12 So, my questions pertain to the barriers to
13 accomplishing comprehensive data collection and
14 safeguards that exist.

15 On the barrier side, the whole thing we're
16 trying to accomplish here is an open and transparent
17 market for energy efficiency, for energy performance.
18 And that requires data and it requires visibility.

19 There's another force out there that kind of
20 acts in opposition to open and transparent, you know,
21 display and dissemination of data, and that's the
22 concerns about privacy due to the identity theft crisis,
23 frankly, that's gripping the country and the world.

24 So, that's a -- you know, there's laws, there's
25 criminal liability around, you know, disclosure of data

1 on the customer side, when it's without permission or
2 it's potentially damaging to the customer.

3 So, we have to keep in mind when we're trying to
4 do benchmarking and we're trying to do AB 1103
5 implementation, et cetera, that there is -- you know,
6 there's this driver that's pulling kind of in the
7 opposite direction.

8 We have policy imperative to open things up and,
9 you know, create that point of sale rating, and
10 visibility and mine that for identifying energy
11 efficiency opportunity, top quartile, bottom quartile of
12 energy users, et cetera, on an energy intensity basis.

13 At the same time, though, there's -- you know,
14 there's a whole industry on the flip side, that's not
15 really, necessarily in this room, that's dedicated to
16 protecting and locking down that information as much as
17 possible. So, we really have to walk a tight line
18 there.

19 And so customer confidentiality winds up being
20 the big driver. Mimi talked about it as far as with the
21 IOUs, and it was certainly my experience that the
22 starting point is one -- given the stakes on the
23 identity theft side, given the stakes, you know, what's
24 at stake there, the starting point is one of less is
25 more. You know, being very conservative about what

1 information is to be shared.

2 So, overcoming that, working with that and
3 working with the holders of the data, the IOUs, POUs, or
4 the State, CEC, CPUC, the holders of the data, the
5 entities that have been entrusted to hold the data on
6 behalf of the data owners, which is the individual
7 customers, all have a stake in being very careful and
8 conservative with how that data is used.

9 So, that's one barrier is just negotiating that
10 very fine line.

11 Operationally, data systems are a big challenge.
12 Mimi talked about that, too.

13 And when you look at -- when you look at the
14 utilities, customer data is typically housed in
15 mainframe type computer systems that have been around
16 for decades, typically.

17 Edison's, I think is close to 40 years old, and
18 DWP's I think is a tad older. But they all generally
19 date back to when these records were first computerized
20 in the first place, back in the sixties.

21 So, you know, the incompatibility of data
22 platforms and then, obviously, security issues around
23 the platforms in which the data is housed is another
24 major -- it's operational, but it's a major challenge on
25 sharing the data and overcoming the barrier of concern

1 about maintaining the confidentiality.

2 The third piece I'll talk about on barriers, and
3 there's a lot of barriers, but this one I haven't heard
4 discussed yet, either, and this is where my disclaimer
5 at the start, about not necessarily representing
6 Edison's official position, comes out.

7 But I'll generalize it to say, you know, on the
8 part of the IOUs, and it has to do with the proprietary
9 nature of customer data. And what that gets to is does
10 a profit-making entity, such as an investor-owned
11 utility, have an interest in using that data for itself
12 for various enterprises outside the regulated sphere,
13 that it does not want to, you know, yield to the
14 competition. Well, it doesn't want to yield to the
15 competition.

16 So, that's a concern, too, that you got to
17 get -- what's the value proposition? What's the value
18 proposition for these holders, these entities that hold
19 this data to play ball? What's in it for them?

20 If they're looking at it as proprietary data
21 they want to mine for an unregulated business on the
22 side, to market with, they don't want to give it up.
23 So, that's an issue.

24 And then beyond that, even if they don't have
25 any plans, any strategic plans for that, they may want

1 to keep the option open or they may just be -- you know,
2 just not have any motivation to go above and beyond a
3 compliance level.

4 So, when it comes to sharing data you've really
5 got to find a way to get these entities invested in it
6 and see a value proposition. There's got to be a value
7 proposition for these entities to play ball on this
8 issue because, otherwise, it's the most conservative
9 route is to be as safe as possible and not release
10 anything.

11 And if it's approached purely as a compliance
12 effort, in other words we just leverage a compliance
13 mechanism, regulatory mechanisms on the entities that
14 hold this data, guarantee you'll get absolute minimum
15 level of whatever it takes just to be compliant, and it
16 won't be a true model of cooperation.

17 So, those are the major barriers I see. And
18 I've kind of covered some of the strategies for -- for
19 the safeguards, but I'll just touch on a few.

20 Obviously, the customer confidentiality laws
21 that are in place are designed to protect the data and
22 define what the various -- you know, what constitutes
23 confidential data, what is self-identifying -- or
24 identifying data.

25 But a safeguard to work around that or work with

1 that is when you can get the owner of the data, the
2 customer to authorize the release, so there's manual
3 processes to get that, to sell them on that and get
4 that.

5 Also, non-disclosure agreements between parties,
6 I mean we talked about that and we certainly, you know,
7 between the utilities, and other entities, city, local
8 governments often -- often will engage in a non-
9 disclosure agreement.

10 The idea is there that with the binding non-
11 disclosure agreement in place between, say, a utility
12 and the local government they can trade that identifying
13 data back and forth as long as it stays protected within
14 each other's systems without prior authorization from
15 the owner, from the customer.

16 But that's fraught with risk as well, if you're
17 looking at it from purely a risk mitigation stand point
18 because you've got to trust, or you've got to know that
19 the entity you're sharing through the non-disclosure
20 agreement truly has a bullet-proof data system in place,
21 that is not likely to be hacked, et cetera.

22 And, frankly, I don't know, I haven't seen, I
23 haven't experienced what that non-disclosure agreement
24 process looks like when it gets to the enforcement side;
25 in other words, if somebody blows it.

1 If the local government, or the IOU, or whoever,
2 if one of the parties to the non-disclosure agreement
3 doesn't follow it I haven't seen what happens, but I
4 have to imagine it's probably not pretty.

5 (Laughter)

6 On the systems side, you know, you can develop a
7 data solution for everything, but you need time and
8 money and we have quite an imperative to move quickly on
9 a lot fronts with energy efficiency and with data here
10 for a number of reasons. You know, the climate target's
11 AB 32, job creation, et cetera, and it's just hard to
12 get -- it's hard to make that happen expeditiously, in a
13 quick period of time to build secure portals and get
14 everybody on the same page from a data format stand
15 point.

16 And, finally, the last point I'll leave with is
17 on the issue of aggregation and redaction, and Mimi
18 touched on this, too.

19 One of the things I experienced in trying to
20 negotiate between -- when I was in Edison, walking the
21 fine line on the privacy versus the transparency, using
22 the market data for data mining and opportunity
23 identification was, you know, I had to negotiate between
24 the utility's own internal risk mitigation and the goals
25 of what we were trying to accomplish from a policy stand

1 point.

2 And what I found, in my experience, was that
3 those weren't necessarily 100 percent oppositional.
4 They might be far apart, but what you usually had was
5 you had somebody asking for something and then somebody
6 saying no to that.

7 But what I found is that there's usually a
8 middle ground. There's usually a point somewhere in the
9 middle that is less than what the original ask was, but
10 still accomplishes the broad goals that we were trying
11 to get to, and that less than the full boat ask is
12 something that's acceptable or can be acceptable to the
13 entity that holds the data.

14 That's really the art is finding -- you know,
15 there's the data you want, the data you think you need,
16 and then the data you need to do what you're trying to
17 do, and often those are different things.

18 And so by looking for that and teasing that out
19 you can find that middle ground and make things happen.

20 Thank you.

21 MS. BROOK: Great, thank you, David.

22 All right, next is Steve Schmidt. Steve is the
23 Founder of High Energy Audits, a Silicon Valley Software
24 Company using Smart Meter data to pinpoint wasted energy
25 in homes. The software has been used to remotely

1 analyze over 1,200 homes, including about 200 in an
2 Energy Commission-funded program that saved over 500
3 megawatt hours of energy.

4 Steve has engineering and business degrees from
5 Stanford and received the second highest score in his
6 class on the HERS written test.

7 (Applause)

8 MS. BROOK: Steve.

9 MR. SCHMIDT: Thank you very much, Martha.

10 It's really an honor to be here. This is my
11 first CEC Commission panel, so I hope I don't screw up
12 too bad so that you'll invite me back, because I've
13 learned so much over the past day, this is great.

14 So, I'm going to address question number 23
15 which is, basically, what's the promise of Smart Meter
16 data?

17 And I want to say your timing is perfect. We're
18 at the confluence of three big things that are happening
19 at the same time, and it is the perfect time to come up
20 with a new method to deal with energy efficiency in
21 existing homes.

22 Those three things, I'll go over them quickly
23 and then I'll go into more detail.

24 One, Smart Meters, they're out there. They're
25 installed in California.

1 Two is access to the data and I'm going to talk
2 about why I believe that is available now, we can get to
3 it.

4 Three is software that can analyze the data and
5 make raw data into something very useful.

6 So, number one, what are there, 10 million Smart
7 Meters deployed in California? It's amazing most
8 California homes right now have Smart Meters. And many
9 of them not only have electric Smart Meters, they have
10 gas Smart Meters. So, we are way ahead in that area, I
11 don't think there's any debate about that.

12 Number two, Smart Meter data is available.
13 Okay, if we tried to do this two or three years ago it's
14 a completely different story, but this is happening
15 very, very quickly.

16 We started collecting Smart Meter data from
17 customers about two years ago, two and a half years ago
18 and it was all PG&E's territory down in the Silicon
19 Valley.

20 And the way we did it -- the way we do it with
21 most of our programs, our 1,200 homeowners that have
22 gone through our service is they opt in. So, they're
23 giving us access to their data.

24 So, the security issues, the privacy issues,
25 they're saying we're giving you access to this data.

1 We ran into a glitch about a year ago when PG&E
2 changed the way they store their information and display
3 their information to their customer, and it shut us down
4 cold. At that point we only had like 300 people that
5 were in the system, but we couldn't access any of their
6 data.

7 The CPUC did a great job, it bubbled up to them
8 within a couple of days. Commissioner Ferron and a
9 bunch of the CPUC Commissioners said, you know, this is
10 a critical issue; we've got to address this. They had
11 discussions with the IOU and within a week we had the
12 data back.

13 So, this has already bubbled up, it's very clear
14 in law that if a homeowner says to a third party you can
15 access my data, then the utility has to make that data
16 available.

17 So, at the same time about a year ago, the White
18 House began pushing the green button file format, which
19 is wonderful. And all three California utilities, IOUs
20 adopted the green button format so that any customer of
21 the IOU can download their usage information, their
22 Smart Meter data into a file.

23 Now, it's kind of a cumbersome process, that
24 original one was cumbersome because you have to sign
25 into your account and you download a file. It's a

1 snapshot of your energy use, it's not ongoing data. But
2 you can do that today and then you can upload that
3 file -- there's like 68 software in the companies in the
4 U.S. right now, that analyze green button data, and
5 they'll tell you lots of different things about it.
6 This is where innovation really thrives. It can give
7 you all sorts of analysis, whether you're ripe for an
8 electric vehicle or whether your idle loads are too high
9 in your house, there's just a whole bunch of analysis
10 that can be done.

11 Just a week ago, last Monday, the White House
12 announced Green Button Connect. And I was back there, I
13 had been invited by PG&E. PG&E was there, San Diego Gas
14 & Electric was there announcing Green Button Connect,
15 which is a machine-to-machine interface, a much, much
16 easier interface to Smart Meter data.

17 And we got it working. I'm proud to say that
18 Energy Audits was the first company in the U.S. to have
19 established this machine-to-machine connection with PG&E
20 so that we get not one-time data, but ongoing data.

21 Now, a user, a customer has to approve that,
22 they have to opt in. And before we could be accepted by
23 PG&E we had to go through a very difficult third-party
24 security audit, where they analyze how we store the
25 data, what we store, what the interfaces look like, what

CALIFORNIA REPORTING, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 the security is like. We can do this, this is something
2 that can be accomplished.

3 In testing, before we went back last Monday for
4 the event in the White House, PG&E gave us access to
5 about 1,700 accounts that were anonymized. This is no
6 personal information.

7 And over a weekend we ran an analysis of those
8 1,700 accounts showing some aspect of their energy use.

9 This can be done, this is not a problem. So,
10 that's the second bullet.

11 So the -- oh, I lost my cheat sheet here.

12 So, the second bullet was the data is available.
13 But Smart Meter by itself, Smart Meter data by itself is
14 just raw data, it's like an MRI machine produces a whole
15 bunch of raw data and it's useless until the software
16 that's been developed to analyze that stuff presents it
17 in a format that a doctor can say, oh, there's a tumor
18 on that liver, or whatever.

19 So, it's the software, the analysis software
20 that has to make this data useful.

21 So, that's where Energy Audits and a bunch of
22 other companies, Retroficiency's on the panel this
23 afternoon, First Fuel is doing it, Noesis Energy,
24 there's a bunch of companies doing this now and it's
25 very useful.

1 What we do, in particular -- well, I want to say
2 we do this analysis and, in our case, we do the
3 equivalent of a household energy audits. And these
4 audits are just dirt cheap. I mean you could put this
5 service, ours or another one, onto the Energy Upgrade
6 California website and offer it to every homeowner
7 for -- I mean at that volume it's less than ten bucks a
8 house. It is just so easy, software scales really,
9 really well.

10 And what we do with the data, Martha showed a
11 great diagram that showed the distribution of energy use
12 across different houses, and you cut it up by low use,
13 high use, et cetera.

14 MS. BROOK: Uh-hum.

15 MR. SCHMIDT: What we do is we actually break it
16 down into a couple different categories, categories that
17 make sense based on what you can learn from Smart Meter
18 data.

19 So, I want to show an example. Hopefully,
20 there's flyers outside and, Commissioner, I hope you got
21 this as well.

22 This is the type of analysis we do for three
23 different homes, and I'm showing two different diagrams
24 for each home. One is just a pie chart that says here's
25 how much money this homeowner is spending in different

1 categories.

2 The other one, the more complicated stack chart
3 is showing how the energy use changes throughout the
4 year.

5 And what you're seeing very, very quickly in
6 these three homes is you'll see a home at the top that
7 has a lot of red. That's the energy that's going
8 towards heating that house. So, I don't know if I can
9 see the number here, but 67 percent of their energy
10 spent is going towards heating. This is a prime
11 candidate for Energy Upgrade California.

12 Got to get to that house and do a HERS audit,
13 get to that house and figure out where the problem is.
14 You can't -- with Smart Meter data you can't figure out
15 whether it's the ducts or the -- oh, no.

16 (Laughter)

17 MR. SCHMIDT: The second house down is more
18 typical, a lot of different use. What you'll see in
19 this house is that they have a pool pump and it's this
20 yellow section that we call recurring loads. There's a
21 big load that comes on for six hours a day. They have a
22 pool, it's a pool pump.

23 Well, what do you do for that house? You make
24 sure they're not running their pump too long or you give
25 them a new, more efficient pump.

1 Lastly, the house at the bottom uses a lot of
2 energy and only eight percent of it goes to heating and
3 cooling. So, a contractor could go into that house and
4 do \$50,000 worth of retrofit work and their energy bills
5 would not change.

6 So in that house it's behavioral issues and it's
7 a whole bunch of plug loads, standby loads, appliance
8 loads.

9 Let's see, I wanted to mention briefly that for
10 EM&V Smart Meter data is absolutely wonderful because
11 not only can you see what the house was doing before the
12 measure, but you can follow it afterwards. So, we're
13 tracking the energy use of all 1,200 homes that have
14 gone through our service so far and we can tell whether
15 their energy use is going up or going down.

16 And then, finally, Martha, you wanted me to
17 mention something about the credibility of the analysis.
18 Do you want me to jump on that or do you want to move
19 on?

20 MS. BROOK: Well, let's talk about it if it
21 comes up in the discussion, after everyone's had a
22 chance to speak.

23 MR. SCHMIDT: Great, thank you very much.

24 MS. BROOK: Thank you, Steve, that was -- all of
25 you so far I'm learning tons, this is wonderful. We

1 could be here all day and I'd be happy, but we have to
2 keep going.

3 So, Fran Inman is next. Fran is a Senior Vice-
4 President of Majestic Realty Company and is responsible
5 for government relations. Majestic Realty is one of the
6 nation's largest privately owned real estate firms.

7 Headquartered in Southern California, Majestic
8 Realty owns more than 70 million square feet of
9 commercial real estate across the United States.

10 Majestic's portfolio includes office parks,
11 retail centers, specialty and hospitality properties, as
12 well as master-planned business parks ranging in size up
13 to 1,200.

14 Fran also serves as a member of the California
15 Transportation Commission and is widely recognized for
16 her efforts relating to the global supply chain.

17 Fran, thank you.

18 MS. INMAN: Well, thank you. First, I'll start
19 with why am I here? About seven or eight years ago I
20 was in the midst of debates around cleaning up the
21 global supply chain and greening the global supply
22 chain, and I flew back in to Ontario, from Sacramento,
23 and I looked at these big flat roofs and I thought, you
24 know, we're having all these fights over the definition
25 of a port truck, meanwhile I have lots of sunshine and

1 these huge, under-utilized assets, big flat rooms.

2 So, at that point I hired your Chairman, Bob
3 Weisenmiller, who was MRW at the time, who became my
4 friend and energy mentor. So, to summarize, I'm here
5 because of really having one of the greatest energy
6 mentors I think anybody could have.

7 So, I want to start off and say that I am an
8 energy language learner. I like to say I speak
9 logistics as a second language because of my work on the
10 global supply chain. So, I don't have all of your
11 acronyms down, so this will be quite basic.

12 But as was mentioned, Majestic's privately held.
13 I think that's important because of the fact we have a
14 little different model than some of our competitors.
15 Most of our competitors today are real estate investment
16 trusts and they have different objectives, sometimes.

17 We're in for the long term, we build and hold,
18 so we have accumulated 70 million square feet across the
19 United States over the years, we're 65 years old.

20 So that really, we take a real long-term
21 perspective and I think that's why we were fascinated to
22 become students of renewable energy. And I have to
23 admit that we're not there, yet, because of the fact --
24 not that we haven't tried, but just figuring out for our
25 largest sector, which is warehouse distribution sector,

1 what really would work. And the California Solar
2 Initiative, with net metering, did not apply for us.
3 And then we've looked at, I think, every other option
4 that has come across our desk. Today, I've taken a
5 pass.

6 So, I want to say thank you for having me here
7 today. I recently read an article from the Stanford
8 Center for Social Innovation and it talked about why we
9 don't get to the goal line quicker on some of our
10 objectives, and it's because we don't have enough doers.

11 So, I'm encouraged to have IKEA on the panel
12 later today, but I think we really do need to get more
13 participation amongst my colleagues in the commercial
14 real estate sector.

15 I was fascinated by your very colorful charts,
16 Martha, and I, too, love data and information. I think
17 the collage that was presented is so very important for
18 all of us because clearly there is not a one-size-fits-
19 all answer.

20 And I think we can go be penny-wise and pound-
21 foolish when it comes to really improving efficiency for
22 all of us if we don't really dig into the trenches, so
23 to speak, understand -- I would use the phrase "please
24 understand me" and I think that will be good for all of
25 us to really learn about the various perspectives and

1 figure out where is that happy meeting ground where we
2 can all succeed together.

3 So, as I'm listening this morning and I'm
4 supposed to answer the question about major barriers,
5 and I may drift a little bit. And I have to tell you
6 that amongst the staff here we kind of had a little
7 debate about where do I really belong, being a fish out
8 of water, but here I am.

9 I also continuously wear my Transportation
10 Commission hat. I proudly serve the State and focus,
11 obviously, on modes of transportation, except the high-
12 speed rail is a separate commission.

13 But my particular expertise and where I spend a
14 lot of time relates to the global supply chain. So,
15 with that I've been participating in the recent Export
16 Initiatives, and also in the push for energy-efficient
17 vehicles.

18 So, I'm sitting here thinking about the
19 description of how we all live our lives, and now I have
20 to plug in my iPhone every night so I can make sure that
21 I have power, and I can talk to everybody I need to talk
22 to the next day.

23 But thinking about the electric vehicles and
24 how, if we move towards electrification of fleets what
25 are those -- what's that going to do to the charts?

1 So, I think it really is important for all of us
2 to have, really, these integrated discussions in terms
3 of what will be the impact.

4 Ocean lining is another push to really green the
5 supply chain, but that translates to plugging in a big
6 ship. I've been told that plugging in one ship for the
7 weekend represents 7,500 homes. So, as having the
8 nation's largest ports in the San Pedro Bay area, and
9 then the efforts of our Oakland Ports, it's -- we can't
10 just look in isolation here, I think we really need to
11 have these integrated discussions.

12 So, back to my question, the major barriers to
13 accomplishing data; to me it really is important that we
14 have relevant data that's meaningful and useful.

15 And when I looked at Cody's slides this morning,
16 talking about the fact that the operational data was
17 optional, to me, in our core competency, the warehouse
18 distribution sector, we have basic -- from the
19 landlord's perspective, we have two identical buildings
20 in a business park. One can have dry storage and one
21 will have manufacturing. Well, clearly, the
22 manufacturer is going to use more power.

23 Is that a good thing? I, personally, think so.
24 Without judging how efficient his processes are, I would
25 love to have more manufacturing in the United States.

1 But that's going to take more power than the dry
2 storage.

3 Also, from the landlord's perspective because
4 we've had -- we've been in many of these debates around
5 1103, in terms of our sector and the warehouse
6 distribution's built on a triple net lease, as opposed
7 to offices are full service leases, which means that
8 your landlord, you know, basically gets a power bill and
9 deals it out on a pro rata basis.

10 But in the warehouse distribution sector, with
11 the triple net lease, we are not party to those
12 transactions between our tenants and the utilities, so
13 it's a little bit difficult.

14 And then I think, really, it's the tenant that
15 controls the decision on the tenant improvements.
16 Basically what happens when we negotiate is there will
17 be a TI allowance, if I can use some of our lingo from
18 commercial real estate.

19 And then we'll debate back and forth what that's
20 going to look like.

21 What we have found for most of our tenants is
22 the lighting efficiencies. We have actually on the
23 buildings that we build that are spec buildings, all of
24 our new buildings that are over 160,000 square feet will
25 qualify for the Section 179(d) tax credits.

1 So, I think with Title 24 in the State,
2 basically for what we do today, the basic shell is
3 probably about as efficient as we can get.

4 When it looks to energy use most of the
5 discussions, and I think what the tenants are looking
6 at, their all-in cost, can have to do with the
7 transportation costs and the efficiency within
8 transportation.

9 So, hopefully, for all of us we will drive
10 towards efficiency that's meaningful. As we do that,
11 and I think what we can all do together is get more
12 folks to give more examples.

13 It's tough even in the logistics sector.
14 Freight moves constantly and logistics theories change
15 constantly as everybody is trying to drive absolutely
16 every penny out of the supply chain. So, I think it is
17 important at the end of the day a business in California
18 is going to look at their all-in cost and one component
19 is energy.

20 We happened to be headquartered in the City of
21 Industry and very proudly market to our buildings there
22 that our local electricity is very, very reasonable in
23 the City of Industry and competes often very effectively
24 against our buildings that are located in our investor-
25 owned that's nearby.

1 But I think that conflicting objectives we're
2 going to have to watch out for as a State and make sure
3 that we make great decisions.

4 I think the options to collect pertinent energy
5 savings, really, we need to be comparing apples to
6 apples. And it's not as simple as rating a building
7 when that tenant has moved out because the new tenant
8 coming in, in all likelihood, will have a different
9 operation and different transaction.

10 So, we heard a lot about education and I think
11 that's important.

12 MS. BROOK: All right, thank you, Fran. And I
13 was going to ask you a question but we ran out of time.
14 So, hopefully, we'll get to that next.

15 MS. INMAN: I wasn't even looking.

16 MS. BROOK: So, I think that behind me they're
17 basically moderating my session for me, so I guess I
18 need the help.

19 So, next up is Cassie Bowe. Cassie is a public
20 policy and market development analyst at SunPower
21 Corporation, a large, vertically integrated solar
22 company based in San Jose.

23 At SunPower Cassie analyzes the effects of State
24 and Federal policy on SunPower's business strategy.

25 Prior to working at SunPower Cassie received her

1 BA in economics and government from Harvard University.

2 Cassie, thanks for joining us today.

3 MS. BOWE: Do I not get a cheer for an economics
4 degree?

5 MS. BROOK: Not from me. I'm sure --

6 (Laughter)

7 MS. BROOK: I'm sure from lots of other people,
8 but not from me.

9 MS. BOWE: I guess I'll have to go back to
10 school.

11 So, as Martha said, I work in public policy for
12 SunPower. We're a large, vertically integrated solar
13 company. We employ over a thousand direct workers in
14 California. We also work with 200 independent dealer
15 partners who install our systems throughout the State.

16 So, I'll be answering questions 19 and 22, so
17 just more broadly talking about the CSI online database
18 for the solar industry, consumers, and then how that
19 type of data can be valuable for businesses more
20 broadly.

21 And I just want to clarify that the CSI online
22 database is just for the IOUs, and it's just for solar
23 systems that receive a CSI rebate. And I'll get to the
24 importance of that later.

25 So, I think that one of the main ways that we

1 use the CSI online database is to analyze the effects of
2 technology, financing, and other business offerings on
3 our market share.

4 So, for example, when third-party financing for
5 solar systems was becoming popular companies immediately
6 could see how is that affecting my market share, how is
7 my price competing, and I think that facilitated the
8 adoption of third-party financing in California. So, I
9 think that's an interesting example.

10 And when we don't have that kind of data we have
11 to rely -- which is really most states we have to rely
12 on third-party reports, which vary in their accuracy and
13 their methodology.

14 So, what we'll end up doing a lot of times is
15 using the lessons that we learned in California, the
16 broad economic lessons and applying them to other
17 markets, so I do think that makes California a more
18 attractive place for companies to do business, given
19 that we can see the effect of our decisions there.

20 And so I think that another value of the
21 database is that it has served as the industry standard
22 for data collection for other states. And we've seen
23 New York, Oregon, Vermont, among others, develop
24 databases that are clearly modeled after the CSI, and I
25 think that's been really valuable for the industry.

1 So, it also helps consumers, this online
2 database, particularly because having visibility into
3 industry pricing makes us more competitive as companies,
4 which lowers prices to consumers.

5 Additionally, it helps us reach consumers in
6 market segments and regions that are under-served, which
7 helps us access more customers.

8 And so I think the combination of those things
9 are a big reason why CSI has been so successful, it's
10 three to four years ahead of schedule. And so I think
11 that the access to public data has helped us reach
12 consumers more quickly and more cheaply than we would
13 have otherwise.

14 And we've been able to do this, as Mimi said,
15 without infringing on sensitive business and personal
16 data.

17 I agree that it's not about the data you
18 collect, but how you display it. It's displayed zip
19 code, county and city level.

20 I also agree with Mimi that going forward if we
21 could find a way to merge it with some sort of
22 demographic data that would be really valuable to solar
23 companies.

24 And then from the business side, the top level
25 price data, it doesn't include any information about

1 financing costs, or deal structure, or profits, so it's
2 not sensitive in that way.

3 So, I think that a CSI type database can be
4 really valuable for energy efficiency, but I also want
5 to point out that developing a clearer path towards
6 proposed CSI data collection method for the solar
7 industry is also important.

8 CCSE just announced that on an application
9 basis, in San Diego Gas & Electric residential sector
10 they're all finished with their CSI, so those customers
11 won't be apply for rebates anymore and so we don't have
12 a way to access their information.

13 So, that's a pretty urgent issue for us. I
14 think that collecting that data remains valuable in a
15 post-CSI world as we still try to meet the State's
16 policy goals.

17 I do think that we'll have to address the
18 questions, which energy efficiency will as well, which
19 are what's the incentive for the business to do this?

20 And I think I counted 104 categories of data in
21 CSI right now so, you know, maybe that will involve
22 streamlining some of that data and figuring out what the
23 minimum burden is.

24 But we are looking forward as a solar industry
25 to working with the Energy Commission and the PUC to

1 develop that going forward. So, thank you.

2 MS. BROOK: Great, thank you, Cassie.

3 All right, Andrew, do you have any --
4 Commissioner McAllister, do you have any questions for
5 the panel before we open it up?

6 COMMISSIONER MC ALLISTER: Yes, I do. This
7 is -- I've been waiting for this panel for the last
8 couple of weeks because I --

9 (Laughter)

10 COMMISSIONER MC ALLISTER: Not that I'm going to
11 use up all the time or anything, I'm actually really
12 interested in what folks have to say and questions
13 people have here. But I was, you know, instrumental, I
14 think, in getting the CSI database started in the first
15 place, and I think was really pleased that we were able
16 to have a fairly concise and relatively quick, in the
17 grand scheme of things, discussion at the front end with
18 the utilities, the other program administrators, and the
19 PUC. This is when I had a different hat on and I was
20 involved in the administration of the CSI.

21 And we were able to get to that end point and I
22 think go feel-by-feel, and figure out, okay, is this
23 okay to release? Is this okay to release? And
24 everybody said okay and we did it, and now it's live.
25 And I agree, it's been really instrumental in helping

1 the marketplace develop.

2 I guess, so I want to -- starting now and going
3 forward I really want to dig into that. I want to make
4 sure that we're focused on digging into the issues of
5 what a sort of low to mid common denominator -- you
6 know, not least common denominator, but some database
7 that we can develop that -- and what the form for that
8 is, who facilitates it, what the sort of pressure points
9 to actually get the data submitted, you know, if we
10 don't -- you know, if we can have a centralized sort of
11 application, a reporting requirement, or if there's some
12 other way to get relatively comprehensive, relatively
13 good coverage across programs and utility service
14 territories, and local governments, et cetera, what that
15 might look like.

16 But also what the fields that are the ones that
17 are not controversial, that wouldn't have to go through
18 the full sort of legal kind of -- sort of discussion,
19 you know, that we heard about.

20 That enables us to be a relatively accessible
21 and flexible, kind of quickly implementable mechanism.

22 And so, you know, we're not talking, probably,
23 about EM&V level data, at least in a publicly accessible
24 database. But we -- you know, it could be as simply as
25 any project funded in some way by ratepayers or other

1 public funds, on the energy efficiency front, and what
2 it's basic characteristics were, zip code, you know,
3 measures, cost or maybe we can get to something like
4 incremental cost of the energy efficiency component of
5 the project, who installed it, whether it got financing,
6 you know, and it got two windows and an HVAC, and did a
7 duct test.

8 You know, it doesn't have to be the whole range,
9 you know, it doesn't have to be hundreds of fields, but
10 I just think that something like that is useful.

11 And by the way, the marketplace also used that
12 data to beat the PUC and the program administrators over
13 the head for needing improvements on their program
14 design. So, this is not all about just the regulatory
15 community or the policy community, or the business
16 community having access to data, this is about
17 accountability all around.

18 And so I think it's really important to point
19 out that this is a public resource and that it actually
20 has -- if designed right, it has utility all around. I
21 mean it could help the utilities achieve their energy
22 efficiency goals. It can help their stakeholders, and
23 partners, and local governments, and the business
24 community do a better job and be on board with the
25 utility programs.

1 I think there's just a lot of upside to having a
2 resource like this. So that is one aspect, right.

3 And then we also have -- so, maybe that's a
4 unique path and so I'm asking you to indulge me here as
5 I put -- you know, one potential vision. So this is
6 just -- this not done, right, I mean this is just ideas.

7 And then the other -- the other need is to have
8 this more robust sort of EM&V-focused, you know,
9 actuarial kind of data about actual impacts and having
10 some statistically valid results of what the energy
11 savings and other impacts of these initiatives actually
12 are.

13 So, that is a much -- that is a different
14 discussion, I think, and it's got more to do with the
15 proprietary data and sort of, I think, the security
16 issues and all those are really front and center.

17 So, I would really invite the investor-owned
18 utilities, I know there's some SDG&E folks in the room
19 and then certainly, probably, I think Edison and PG&E
20 are also here.

21 So, if now or in your comments it would be great
22 to hear sort of the -- the options there, as you see
23 them for engaging with the marketplace in a way that's
24 as flexible and sort of manageable as possible. Because
25 I think that's really what we're talking about is what

1 public resources we can develop and manage to help
2 people make a decision to the marketplace.

3 So, and I think that Steve's tool and other
4 tools that are out there have a lot of potential to sort
5 of skirt some of these legal issues and allow the
6 customer to have control. But also, it will happen to
7 engage the contractor and the participants to get better
8 information and make better decisions.

9 So, that's really it, getting information, using
10 the available information to make decisions I think
11 should be our organizing principle here, and invite
12 everybody's expertise to sort of figure out how that
13 happens in practice. So, that's sort of -- I'd like
14 just to sort of have that kind of -- you know, hopefully
15 give people some direction to think about these issues
16 and bring their expertise to the table.

17 MS. BROOK: I was waiting for a question mark,
18 but I didn't hear it, so that's okay.

19 So, does anybody, quickly, on the --

20 COMMISSIONER MC ALLISTER: This low- to mid-
21 common denominator data, like what does that look like?
22 Like what data really needs to be in the public's -- how
23 would you envision this database looking, you know, if
24 we go there and we download an Excel spreadsheet what
25 should it contain?

1 MS. BROOK: Thanks.

2 MR. SCHMIDT: I can talk from just the energy
3 analysis perspective. We just need the interval data
4 that's the hourly data and that's their energy use. And
5 there's programs, like in Texas, there's Smart Meter
6 Texas where all the utilities operating in Texas have to
7 provide access to customer's energy use, real interval
8 data through a common portal.

9 And I know Vermont's working on the same thing.
10 Texas did it too early so they missed the standards.
11 They're just a progressive state, it's really very
12 impressive.

13 (Laughter)

14 MR. SCHMIDT: But I know Vermont is working on
15 it and they're going to use standard formats for that
16 and that will be a huge help.

17 COMMISSIONER MC ALLISTER: Well, actually, let
18 me just qualify. So, I think -- so maybe we're talking
19 about two different things. One is like an Excel
20 spreadsheet that just has project information. So, you
21 know, SunPower and other entities have used it to say,
22 okay, where are the projects going in, how much do they
23 cost, what geographies, what climate zones, they've
24 mapped it into, you know, art view or whatever.

25 So, that's sort of one thing, just basic market

1 information.

2 And then, Steve, you're talking about the
3 individual customer making the decisions at that level
4 and using much more detailed information sort of behind
5 the wall, right.

6 So, really, I think those are two different
7 things and they're both incredibly useful, so I think we
8 need both. But I'm really referring to sort of the
9 former. You know, what project level market data,
10 project data could the market use to help business
11 develop, for example, help design programs?

12 MS. FRUSHA: I can jump in on the project data;
13 or David if you were going to jump in.

14 I think a couple of -- at least one distinction
15 with this project data that we have to complete is even
16 though we are moving towards a more comprehensive energy
17 efficiency retrofit sort of offering, we also have to
18 think about how we capture some of this more flex path,
19 or single measure versus comprehensive.

20 COMMISSIONER MC ALLISTER: Uh-hum.

21 MS. FRUSHA: So that, in and of itself, may
22 inform what data we want to collect, because if you're
23 collecting comprehensive, at least under the existing
24 Energy Upgrade California program, we have energy
25 profiles that we're pulling all the data from, so it's a

1 pretty extensive set of data.

2 But at the baseline what do we need? I mean we
3 need things that are in the CSI database. We have
4 incentive levels, project cost, zip code, city, some
5 information on the measures installed. And I think the
6 question is how granular do you start to get on there?
7 And then I think, ultimately, we want some energy
8 savings information broke out by both electric and gas.

9 But I think the onus really ends up on like who
10 is collecting that information? If you're under Energy
11 Upgrade California and doing a comprehensive project,
12 you have to collect that data.

13 But if you're doing something different what
14 does that -- if you're doing flex path, what does that
15 data collection process look like?

16 So, I think at a baseline I mean we look at CSI,
17 and then we have to really modify the project data to
18 reflect what the energy efficiency data is, what's
19 happening in the home.

20 So, building characteristics, as well, will be
21 valuable, I mean everything from age of the home, square
22 footage of the home. Potentially, if we have occupant
23 information so we can have some asset and operational,
24 obviously recognizing that that will change as the home
25 transfers ownership.

1 But those are some of the elements. I mean
2 right now we have sort of that short list from what
3 we're doing with the warehouse and, ultimately, have had
4 to really whittle down, I think there's like 800 unique
5 fields within EnergyPro. You can confirm that over
6 there, CalCERTS. And, basically, have brought it down
7 to about probably 120, 150 fields, so not unlike what
8 CSI is collecting right now.

9 COMMISSIONER MC ALLISTER: Thanks.

10 MR. JACOT: I just wanted to react to your
11 comments on a little bit bigger picture. I think you're
12 absolutely onto something and it sounds like you,
13 personally, were involved and took advantage of a very
14 unique opportunity and did so quite artfully, the fact
15 that CSI was bottoms up, brand-new statewide. So, you
16 had a blank slate for all the IOUs to get it right from
17 the start, and it's a rare opportunity and it's a window
18 of opportunity that closes quickly without leadership in
19 that area, because otherwise what you have is everybody
20 goes off and creates their own system.

21 And that's kind of where we're at with energy
22 efficiency is, you know, much -- nothing's really from
23 scratch, necessarily. So, there's legacy system --
24 legacy systems abound.

25 And so even though you're generally tracking the

1 same data it's different platforms, it's different field
2 names, different column headings, et cetera. So, that
3 reconciliation lines up being the work.

4 But you touched on -- I mean it's the same
5 whether you're trying to fix that or do it right from
6 the start, which is that you've got to get everybody
7 together and beat through it operationally. You know,
8 got to lock people in a room for six hours and go
9 through every single field and say yes/no, yes/no,
10 yes/no. That's what we do.

11 And that's how we were able to make some
12 headway, too, on some data sharing.

13 And I used to sit down with a lawyer and say do
14 you have a problem with this one? No. Do you have a
15 problem with this one? Maybe. And beat through it that
16 way, so that's what it takes.

17 MS. BROOK: Great.

18 COMMISSIONER MC ALLISTER: Thanks. And, you
19 know, like for example energy savings, so whether that's
20 the -- so, we model savings, presumably, as in
21 EnergyPro, actual savings is a whole different ball
22 game. You know, my tendency would be to just not even
23 talk about savings, just project data, like what's being
24 installed.

25 If I'm an investor and I want to go see what the

1 cash flow is going to be, all I need to know is the
2 project flow, or at least that's kind of the main thing
3 I'm interested in. I mean, and where they got financing
4 and stuff like that.

5 So, just from a market facilitation point of
6 view I guess I'm trying to ask the question is -- is the
7 efficiency industry ripe for that same opportunity as we
8 kind of saw at that stage of the solar industry?

9 And would a -- you know, maybe CBPCA or some of
10 the contractors in the room could give a gut reaction on
11 this, too. Is a resource like that, just know what the
12 projects are out there, okay, there were 10,000 projects
13 in the last two years, and they were in the following
14 places and they had the following characteristics, would
15 that be useful and, you know, if so how might we
16 approach creating something like that.

17 MR. JACOT: I think it does require a different
18 approach because you do have mature programs that have
19 been in place for a long time, with a variety of
20 administrators using different systems. But that brings
21 us around to, you know, leveraging centralized reporting
22 process we already have in place.

23 And I'm not terribly close to this one, but I
24 know that the IOUs report -- at least on the IOU side,
25 obviously, report to the CPUC at a measured level in

1 terms of the annual reporting. So, there's phenomenal
2 data there that's being collected and aggregated at the
3 CPUC, obviously under a non-disclosure agreement.

4 That's at the measure level so that goes beyond
5 even the individual project. And, you know, I recall
6 some crazy number, Edison's accomplishments for 2009
7 yielded a data file with 2 million rows, 2 million
8 individual measures, and that's 2 million rows by 150
9 fields.

10 So, I think it bears taking a look at where
11 those -- where that data probably already exists and the
12 most excruciating level of detail you can imagine, and
13 then working on that strategically to aggregate it and
14 winnow it down to the purposes we're trying to
15 accomplish.

16 MS. BROOK: Great.

17 MR. ASHUCKIAN: Yeah, we have about three or
18 four questions. I'll just read one from Merrian
19 Borgeson, from LBNL. It's basically the same, I think
20 very similar to this question and so we would certainly
21 encourage folks to comment on this, at this point
22 written comments.

23 "What specific data fields should we make public
24 that both protects customers and, too, is useful to the
25 industry?"

1 So, I think that's basically what we just had a
2 discussion about.

3 So, the first up would be Ted Reguly from SDG&E.

4 MR. REGULY: First, great comments, great. I've
5 been involved with both the Smart Meter rollout and the
6 Green Button rollout.

7 I think what we really need to do is have some
8 balance here. I think everybody will agree that
9 customer usage data is very valuable and can help us
10 provide better distributed generation, energy
11 efficiency, and demand response throughout the State to
12 our customers.

13 And move it more into much more of a customer-
14 centric point of view, instead of painting with a really
15 bit, wide brush, we're going to be able to target market
16 various EE measures to our customers in a much more
17 cost-effective manner.

18 But it must be protected and used in a customer-
19 friendly point of view. This data, if it does end up in
20 the wrong hands, could infringe upon our customers. And
21 I think we all want to be viewed as their trusted energy
22 advisors. And all it's going to take is some abuse of
23 this data and we could really hurt energy efficiency in
24 the State more than pushing it forward.

25 So, what I'm saying is, and I like some of the

1 points, I think both Steve and David mentioned earlier,
2 is there's a lot we can do with this data and we can do
3 it on an aggregated or disassociated manner, and we
4 really need to work on the use cases.

5 MS. BROOK: Uh-hum.

6 MR. REGULY: Everybody comes to me and says I
7 want the data. And I say what for, or what data? Well,
8 I want everything. And one of the things, we're a big
9 proponent of privacy by design and one of the key tenets
10 of privacy by design is you limit your exposure.

11 And for San Diego Gas & Electric we've had some
12 very simple things. We had one where we were having an
13 employee event at an amusement park and we gave the
14 event coordinator all our employees' names, telephone
15 numbers, and addresses three years ago, Didn't think
16 anything about it.

17 Their system got hacked and we lost that data.
18 So, really, data minimization needs to be part of our
19 tenet in going forward.

20 And so that's why I'm a big proponent of coming
21 up with like three or four primary use cases around
22 energy efficiency and look at, for those use cases will
23 aggregated data work, or do we need customer specific?
24 And then what does that data need to be combined with?

25 There are some great things right now that you

1 can do with weather data, and the energy data, and you
2 put it together. And if you can know from the
3 communicating thermostat inside the home what the
4 temperature is, and how much that heater or air
5 conditioner -- you really don't even need to go to the
6 building and that is very customer-centric.

7 But if we take it back from another point of
8 view, and we don't get customer consent to get that
9 data, they could see it as being very invasive and big
10 brother and I don't think any of us want to do that.

11 MS. BROOK: Thank you.

12 COMMISSIONER MC ALLISTER: So, thank you, Ted, I
13 agree. So, I think the -- I kind of laid out, broadly,
14 two use cases. One was individual project, but not
15 linked to the customer. And the other was -- you know,
16 is more EM&V and much more involved as far as the level
17 of data, and intrusiveness and, presumably, we'd have to
18 have them behind some screen that's pretty -- very
19 tight.

20 MR. REGULY: Very tight and very -- and we need
21 to limit that access to that data somehow.

22 COMMISSIONER MC ALLISTER: Yeah. So, I guess
23 I'm curious, have you thought about mechanisms, you
24 know, bonding, or insurance, or something like that so
25 that when you -- if you were to enter into, you know,

1 let's say share -- you know, have a significant data
2 sharing agreement with some third party out in the
3 marketplace and maybe it's something other than the
4 local -- well, even with a local government. But just,
5 you know, maybe it's a third party that is going to do
6 some major analysis, you know, whatever, I won't
7 speculate what exactly.

8 But I guess what's sort of your enforcement
9 mechanisms or your sort of -- how would you ideally
10 guarantee compliance, like if that partner that got
11 hacked, like how are they accountable for having opened
12 themselves up to getting hacked?

13 MR. REGULY: So for us, if they're under
14 contract with us that is the best way to protect us in
15 contractual arrangements.

16 NDAs, let us say with an NDA what happens if
17 someone violates the NDA, you have legal action.

18 I also think and this is something that we're
19 working on with Department of Energy is having a
20 collaborative method between the utilities and third
21 parties for best practices in this area, and then also
22 coming up with a trusted, sort of like at your financial
23 institutions or whatever, the e-Trust, where we'll have
24 requirements for people that get, or entities that get
25 this data, they have to meet certain minimum

1 requirements. And then if they don't behave, they get
2 kicked out.

3 This is something that we're also addressing
4 with Scott Anders, at USD, to try to come up with all
5 the reporting requirements that the various State
6 agencies have and what can we do with the data to meet
7 their requirements and still protect customer privacy.

8 MR. ASHUCKIAN: Great, good. Thank you, Ted.

9 COMMISSIONER MC ALLISTER: Thanks Ted.

10 MR. ASHUCKIAN: Next, we have George Nesbitt,
11 with CalHERS. And we're going to break at noon for
12 lunch.

13 MR. NESBITT: Thank you. As a HERS rater and a
14 building performance contractor, as I think you know I
15 firmly believe in asset ratings, but I absolutely have
16 for a decade plus been a believer in operational
17 ratings.

18 The reason is when you look at information in
19 different ways you get different answers. Ratings won't
20 necessarily pull up what this does. It tells -- but
21 it's absolutely valid and important.

22 But if you don't look at this, yes, you will go
23 to house three and try to sell them all the air ceiling
24 insulation and HVAC, because I've been to this house, I
25 know the people that will do that, and you will not

1 touch their bill.

2 Unfortunately, the rest of the industry has
3 dragged their feet, has ignored base load, they don't
4 look at the utility bills and they do try to do that.

5 So, the asset rating naysayers like to say,
6 well, you compare it and it doesn't match and,
7 therefore, it's totally invalid.

8 Well, Mike Blasnik has taken thousands of data
9 points and on average it's accurate. So, having large
10 amounts of data, the more data we have, the more
11 actually accurate and valuable that data is.

12 You look at my house in an operational rating, I
13 am below the low energy user according to PG&E in my
14 inefficient, old house. So, you're going to tell people
15 some really wrong things looking at my house,
16 operationally.

17 Nationally, RESNET built a registry. Every HERS
18 provider -- you've got at least ten HERS providers in
19 Nevada, alone. They did not have to build a registry.
20 We currently have the same core calculation in INGEN for
21 the Energy Code. In 2013 that's going to become public
22 domain and that's very important.

23 So, absolutely, you know, having data, the more
24 common things are -- you know, and not everyone having
25 to recreate the wheel. So thanks.

1 MS. BROOK: Thanks George.

2 Okay, I think we're breaking now?

3 MR. ASHUCKIAN: We have one last comment from
4 Conrad. I don't know if you got your question answered
5 regarding data?

6 MR. ASPER: I just wanted to find out a little
7 bit more. I am excited about the prospects of the
8 operational data ideas that we're talking about here.
9 And as -- you know, it is going to be contractors doing
10 upgrades to reach our State goals.

11 I just wanted to just briefly ask Steve what,
12 from that approach of operational data, how can that --
13 what tools or what things can we provide the contractors
14 to support them in doing upgrades?

15 MR. SCHMIDT: Oh, that's great, thank you. And
16 for both the comments I would come back with the same
17 response.

18 So, the very short story is that when I got my
19 HERS rating you go through a final test where you
20 actually go to a house. And so ten of us went to this
21 house in San Jose and it was a fairly small house, like
22 1,400 square foot. And we analyzed the duct system, we
23 did the blower door test, we did the duct blaster test,
24 we checked the furnace, we checked the air conditioner,
25 and all ten of us walked through and came to the same

1 conclusions that they needed their ducts cleaned and
2 they needed, probably, a new furnace because it was
3 really old, and the air conditioner needed some extra
4 Freon.

5 But no one else walked around the house and
6 found that there were two huge media centers, big TVs, a
7 different box in each one that had a VCR, had a Blu-Ray
8 device, had a game console, two different ones, glowing
9 lights all over the place, and he had a continuous
10 recirc pump in the garage, on the water heater in the
11 garage.

12 So, for 20 bucks for a timer this guy could
13 lower his energy use, both natural gas and electricity
14 on his recirc pump, and for another 20 bucks or 40 bucks
15 for two Smart Strips, he'd dump his electric bill.

16 The reason he was a high energy house was not
17 because of the seal ducts, it was because of other
18 stuff.

19 So, informing contractors before they go in, in
20 our Mountain View project people go through this and
21 then they're directed to different programs based on
22 their energy profile.

23 So, we were working with Ecology Action when we
24 found a home that had more than 50 percent of their
25 energy was going to heating and cooling.

1 We would give this information to the
2 contractor. The homeowners would approve it, but we
3 would send them a profile. So, when they're walking
4 into the house they're already informed, they know where
5 the energy is going.

6 COMMISSIONER MC ALLISTER: Steve, are you doing
7 that with the weather normalization? I mean like Ted
8 referred to taking different data streams and kind of
9 adding them up.

10 MR. SCHMIDT: Absolutely.

11 COMMISSIONER MC ALLISTER: And I assume that
12 you're doing that in the background?

13 MR. SCHMIDT: Absolutely. So, we're analyzing
14 what part of their energy use, both natural gas and
15 electricity corresponds to temperature variations.
16 We're analyzing their base loads so you can see a lot
17 about standby power, and household electronics that way.

18 We're analyzing recurring loads that happen at
19 the same time every day, that's like a pool pump or low
20 voltage lighting outside, stuff like that.

21 There's a lot of data you can mine from the
22 Smart Meter data and you can inform a contractor and
23 kind of split it into different loads.

24 So, the contractors, some of the ones that are
25 working with us are like, this is a desktop audit,

1 before I actually go to a house to talk to them about
2 what they need I can very quickly, the contractors can
3 understand where the issues are and be much more
4 prepared.

5 And some homes they might say, well, you know, I
6 don't even want to visit that house because I know
7 there's not a lot of waste there.

8 But other homes they say, well, we've got to do
9 both the heating and cooling and we've got to try and
10 figure out where all that base load stuff is going,
11 what's with the plug loads. So, that was very useful.

12 MS. BROOK: Good. Okay, thank you.

13 Well, thank you for all you panelists, I think
14 it was a wonderful session. And we're going to break
15 for lunch and come back and talk about commercial
16 building.

17 (Applause)

18 (Off the record at 12:02 p.m.)

19 (Resume at 1:09 p.m.)

20 MR. BURR: Okay, are we all set, can everybody
21 hear me?

22 MR. ASHUCKIAN: Okay, everybody can hear you and
23 your slides are up.

24 MR. BURR: Okay. Well, sorry about that
25 everyone, I hope I gave everybody some extra time after

1 lunch.

2 So, I'm Andrew Burr. I'm the Director of
3 Building Energy Policy at the Institute for Market
4 Transformation.

5 We're a nonprofit in Washington D.C. We've done
6 a lot of work in the past few years on energy
7 benchmarking disclosure policies.

8 A few quick notes, our foundation's funded to
9 assist cities in implementing these types of policies,
10 so we have staff actually on loan sitting in the New
11 York City Mayor's Office and helping them implement the
12 Greener Greater Buildings Plan, and in the District of
13 Columbia helping them implement their benchmarking
14 ordinance.

15 We're also part of a new network called the
16 Global Buildings Performance Network that's funded by
17 Climate Works Foundation, that's trying to bring
18 together building energy efficiency best practices from
19 around the world.

20 So, we're the U.S. hub. The central hub is in
21 Paris. There's a European hub in Brussels, and a
22 Chinese hub and then a hub in India.

23 So, I should be much more of an expert on
24 European certification programs than I am, but I'll do
25 the best I can.

1 I'll try and move pretty quickly, just one
2 introductory slide on motivation of policymakers.
3 I think California was ahead of its time, at least in
4 the United States, when it adopted AB 1103 and then 758.

5 We have a lot of policymakers out there right
6 now that are looking at what's working in other markets
7 to drive demand and competition. In the building
8 sector, of course, we're talking about energy
9 efficiency.

10 They're coming to the conclusion that if there's
11 no information in the marketplace then there will be
12 very little action.

13 The questions at the bottom of the screen are
14 what I hear policy makers asking, how can we make real
15 estate markets work more effectively to drive demand for
16 energy efficiency without the use of public subsidies?

17 How can we reduce costs for business and create
18 jobs?

19 And last, how can we reduce emissions from
20 existing buildings?

21 So, moving on, I'll start kind of around the
22 world and then I'll move into Europe. So, some of you
23 may be familiar with this time line. We think of rating
24 and disclosure policies as a new thing in the United
25 States, but if you look around the world there's quite a

1 lot that's been happening over the past decade and
2 longer.

3 So, the big event was in 2002 when the European
4 Union adopted the Energy Performance of Buildings
5 Directive. This is what all the certification
6 requirements there are part of.

7 Since then Norway and Turkey, which are not part
8 of the EU, but maybe someday, have adopted similar
9 requirements to bring themselves into alignment with the
10 rest of the Union.

11 China adopted a mandatory rating program for
12 government buildings that's also a prerequisite for
13 their Green Building Program, and that was in 2008.

14 Brazil adopted a voluntary program that is
15 supposed to become mandatory this year for commercial
16 buildings.

17 The European Union adopted an Energy Performance
18 of Buildings Directive recast in 2010, trying to fix
19 some of the things that weren't quite working from the
20 original and I'll talk a little bit about that.

21 And then also in 2010 Australia adopted a
22 mandatory rating policy for commercial buildings that's
23 based on their neighbor's rating system, which is quite
24 similar to our Energy Star system.

25 So, moving on to the EPBD, again, some of you

1 may be familiar with this. It was adopted about ten
2 years ago. It was a really comprehensive package of
3 different policies, rating and disclosure was part of
4 it. In Europe they call that certification.

5 This certification covers new and existing
6 homes, nonresidential buildings, and government
7 buildings as laid out in the Directive. All of these
8 certification requirements are triggered by the sale or
9 a lease of a building, similar to in California.

10 The document gave member states the ability to
11 choose whether they wanted to implement an asset or an
12 operational rating.

13 And so what's happened there is asset ratings
14 are being used almost universally for homes and for
15 smaller commercial structures, whereas operational
16 ratings are being used for more complex and larger
17 commercial buildings, and government buildings.

18 The other part of the EPBD was that it basically
19 set energy code requirements across all the member
20 states, many of which did not have them before. It also
21 required the mandatory inspection of boilers and other
22 mechanical systems in nonresidential structures.

23 So, in 2010 the European Parliament adopted what
24 they call the EPBD recast, which fixed some of the
25 things that weren't quite working in the original

1 legislation.

2 It also strengthened the certification
3 requirements, so it put in place mandatory enforcement
4 measures because many of the member states were not
5 enforcing the certification of buildings, and it made
6 disclosure at the time of listing mandatory, which was
7 the intent of the original EPBD, but didn't -- wasn't
8 quite implemented in that way.

9 The other thing the recast did is requires all
10 new buildings in Europe to reach what they're calling
11 nearly net zero by I think it's 2021 or 2020, which is
12 basically a mandate to begin integrating renewables in
13 all new construction.

14 So, a couple of graphics, Ireland is recognized
15 as one of the better certification programs in all the
16 member states. This is a graphic I pulled from an IEA
17 report which is just showing what the distribution of
18 certificates are there, according to their rating
19 system. So, this totals 142,000 certificates from about
20 mid-2010. Most of these are homes. It only includes
21 about 4,800 nonresidential buildings.

22 This next slide is from our partners in Europe,
23 the Building Performance Institute of Europe. What it's
24 showing is sort of the adoption -- the implementation
25 curve for certification schemes across the EU.

1 So, if you look at the sort of greenish shading,
2 that's member states that have adopted at least part of
3 the certification requirements.

4 The gray shading right underneath that are
5 member states that have adopted the full slate of
6 requirements for certification.

7 And then the blue bars below are when the
8 initial implementation rolled out in different member
9 states.

10 So, this thing passed in 2002, it got --
11 implementation got pushed by a few years and most of
12 these programs came online between 2006 and 2010.

13 This graphic illustrates some of the problems
14 they've been having in Europe and it is really a
15 cautionary tale, I think, for U.S. policies. Again,
16 this is pulled from BPIE research in Europe, and it's
17 showing basically how the industry and the public are
18 perceiving the integrity of certification programs in a
19 few member states.

20 So, ideally, this graphic would have a lot of
21 four stars on it, which means very good. But,
22 unfortunately, we're seeing a lot of one and two stars,
23 and I'll talk about some of the issues on this slide
24 that they've encountered.

25 So, first, just some statistics about where

1 Europe is as a whole, 11 member states have now
2 established national certification registers. So, 11
3 member states are now tracking all of the certifications
4 that occur in their countries, which was not required as
5 part of the EPBD.

6 A few more are under development. Ten member
7 states are not, at this point, tracking at all what's
8 going on with the certificates in the market.

9 Nineteen member states have penalties, now, for
10 noncompliance with certification, ten do not. Again,
11 that was -- enforcement was not a requirement and,
12 unfortunately, it was sort of poor in the initial
13 rollout.

14 And then there's been some new research,
15 recently, on certification costs for nonresidential
16 buildings at a half to three Euro per square meter
17 there.

18 So, for smaller structures it's not going to be
19 too much, but it does get costly there, particularly
20 because of the asset rating requirement in many member
21 states.

22 A few challenges, nine member states are still
23 not in compliance with the original EPBD certification
24 requirements. We've heard that in a few member states
25 they've begun rolling back some of these regulations.

1 Unfortunately, it's been sort of a bad time, as many of
2 you know, in Europe to be trying to roll this program
3 out.

4 There have been some complaints in member states
5 about the quality of certification and that's where you
6 really start to lose the integrity and the public's fear
7 about these programs. So, there have been some issues
8 with quality of the certifications and the quality of
9 the assessors that are doing the work.

10 The asset ratings, because it's a very technical
11 procedure it's been very difficult for stakeholders,
12 building owners and people in the market to understand
13 exactly what's going on behind the scenes.

14 Again, that's a bit of advice that I think we
15 can use here in the U.S.

16 There's been poor perception, the last slide
17 showed about the effectiveness of some of these
18 certificates.

19 One of the larger problems has been that there's
20 been very little standardization and comparability
21 between certification schemes in the different member
22 states.

23 So, each member state, basically, has its own
24 certification protocols and methodologies to rate a
25 building.

1 So, if you go between the UK, and Austria, and
2 Hungary, an A in any one of those places is different
3 than what an A would be in somewhere else.

4 The last one is that initial compliance again,
5 unfortunately, was pretty poor in most of these
6 countries.

7 What we find in Europe sometimes is that they
8 have a lot of political will, but it becomes very
9 difficult to actually implement these programs. The
10 directive comes from the European Union, but then has to
11 be translated into national legislation by each member
12 state, which is bureaucratic and can be problematic.

13 So, we'll move on to the United States. This
14 map is showing where policy adoptions have occurred,
15 where there's policy interest currently, and where
16 there's been state interest.

17 So, in general, we're seeing the most interest
18 right now from cities. There have been a number of
19 state efforts, aside from California and the State of
20 Washington very few of these policy proposals have
21 passed.

22 So, there was legislation in Oregon, and New
23 Mexico, in Maryland, Connecticut, Vermont and none of
24 them passed.

25 However, Philadelphia did pass a policy earlier

1 this year. Minneapolis is developing a policy. Chicago
2 is also very interested.

3 And Mayor Menino in Boston, early this year
4 announced his intent to adopt a benchmarking policy for
5 nonresidential and multi-family.

6 So, this slide is showing basically what you had
7 on the map. It's also showing how the different
8 programs break down by what types of buildings are
9 covered and what the disclosure mechanism is.

10 So, you're seeing, if you look sort of toward
11 the left at the top of the screen, a lot of variation
12 right now on where states and cities are setting
13 threshold size minimums for buildings. California
14 should say 5,000 feet, and congratulations on getting
15 the rules adopted.

16 Most cities are going with a larger threshold
17 now, 50,000 feet, with the rationale that they want to
18 focus on larger buildings first, where the stakeholders
19 are more in tune to energy efficiency, where they have
20 more budget to actually implement measures.

21 On the right side of this screen you see the
22 disclosure mechanisms. As I think most of you know,
23 there are two sort of protocols for disclosure. One is
24 that a disclosure is triggered by a transaction, that's
25 what's in California.

1 What we've been moving more toward is a public
2 disclosure, where the city posts data that's publicly
3 available on a website. This is what San Francisco has.

4 In almost all of these jurisdictions disclosure
5 is also accompanied by a reporting requirement to the
6 local government, which is a terrific thing.

7 IMT did some research earlier this year on the
8 impact of these policies, how many buildings and how
9 much square feet they're covering now, nationally.

10 We're estimating about 60,000 buildings and 4
11 billion square feet.

12 The California number on here probably needs to
13 be updated. We did take a look at historical
14 transaction volume from CoStar to try and come up with
15 this number.

16 As you'll see in the building area pie graph at
17 the top of the chart, New York City accounts for most of
18 the floor area that's being covered.

19 And because I'm working a lot with New York
20 right now, I'll just spend a minute describing this
21 program. It's very indicative of sort of the evolution
22 of benchmarking and disclosure policies, as we see them.

23 What New York did was package benchmarking and
24 disclosure with an integrated suite of policies. So, in
25 addition to that they are now requiring, in ten-year

1 intervals, mandatory audits and mandatory retro-
2 commissioning.

3 By 2025 they're requiring lighting upgrades to
4 the City Building Code, and they're requiring sub-
5 metering in all large buildings, of all large tenant
6 spaces. So a tenant spaces 10,000 feet and above.

7 And in addition there's now a requirement on the
8 owner where tenant spaces are sub-metered for the owner
9 to pass energy information back to the tenant.

10 And a couple notes about New York City. Again,
11 it's one of the programs that's farthest along. They
12 had their initial reporting deadline in August of 2011.
13 They extended it to the end of the year and came out
14 with a 75 percent compliance rate, which is just
15 terrific considering the volume of submittals that they
16 had; more than 10,000 buildings.

17 A couple keys here to their success that we do
18 not see in all the jurisdictions that we're working
19 with. The City launched a major outreach and training,
20 benchmarking training effort for stakeholders. They
21 have live informational sessions. They hosted
22 benchmarking training sessions that were broken down by
23 building sector, so there was one for hospitality, one
24 for hospitals, one for office, and so on.

25 They set up a benchmarking help center that

1 stakeholders could call into with questions about how to
2 comply, which we think was tremendously important to
3 achieving such high compliance.

4 And they went to their State PUC and they got
5 ConEd to provide aggregate whole building data to all of
6 the building owners that had to comply.

7 So, ConEd is providing whole building data, now,
8 to any owner in New York City without obtaining consent,
9 as long as there are -- I think it's five meters
10 aggregated together by rate class.

11 The one other interesting thing New York found
12 was the participation by the consultant and energy
13 efficiency services sector. So, New York is estimating
14 that I think it's about 80 percent of submittals were
15 actually done by consultants. So, New York City
16 building owners kicked a lot of this work out to the
17 energy services sector, which has resulted in a lot of
18 very good things for the job market there that I'll talk
19 about in just a second.

20 New York City also, just a few months ago,
21 completed a citywide aggregate analysis of benchmarking
22 results for the first year there.

23 One of the most interesting findings from this
24 report was that energy intensity is actually greater in
25 newer buildings than in older buildings. This is true

1 both for office and multi-family. And multi-family
2 accounts for three out of every four buildings that had
3 to comply there.

4 They also found Energy Star scores for office
5 buildings tended to be higher, again, in older buildings
6 than in newer buildings.

7 A quick word, IMT's done some research this year
8 on the job impact of benchmarking. We released one
9 study earlier this year that looked nationally if there
10 was a rating and disclosure policy. We put together an
11 industry panel that included pension fund investors,
12 large commercial managers and owners, and the conclusion
13 was that these policies could create almost 60,000 net
14 new jobs by 2020.

15 At the same time, we went into New York City and
16 said, well, what's actually going on in the ground in
17 one of these markets? So, we interviewed about 15
18 energy services firms and what we found was that a lot
19 of them are doubling their staff and they just have a
20 tremendous amount of new business. Really, for the
21 first time, a lot of owners are looking at how their
22 buildings are performing and then asking critical
23 questions like how can I improve.

24 The primary issues and one of the surprising
25 things we found is, as we talked to these guys, these

1 vendors, they said the primary issue for them was not
2 financing, it was demand. So, in other words, they
3 weren't going to owners who were saying, well, we'd like
4 to do something but we just can't finance it, it was an
5 issue of owners not understanding what the opportunities
6 are and the benchmarking has really opened up a whole
7 new energy efficiency market there.

8 So, my last slide, just a couple challenges that
9 we see across the country. Policy harmonization between
10 jurisdictions will become increasingly important.

11 I hear, increasingly, from BOMA and the Real
12 Estate Roundtable, the big real estate trade groups,
13 that this is very close to the top of their priority.
14 The only thing they hate more in some cases than these
15 requirements is having to comply with 10 or 15 different
16 requirements in 10 or 15 different places.

17 And we think that standardizing this stuff will
18 actually help them comply, so that's a good thing.

19 Again, energy consumption data and the owners'
20 access to that from utilities is probably the biggest
21 challenge that's still out there. In all of these
22 jurisdictions they need to do their homework and legwork
23 in approaching utilities and regulators to try and
24 figure this out before a policy's adopted.

25 We're also working with the Administration and

1 the Department of Energy to look for national or Federal
2 solutions.

3 Quality assurance, no jurisdiction so far as
4 really established a rigorous QA protocol for the data
5 that's coming. And the danger here is that, again, with
6 Europe as a cautionary tale, you get a news article
7 somewhere that quotes a bunch of building owners that
8 are saying, well, we don't really trust this data, it's
9 something we have to do, but it doesn't really mean
10 anything.

11 And I think if that happens, then we've lost a
12 lot and it's difficult to get credibility back.

13 The proliferation of rating tools and the
14 integration of these tools will be tremendously
15 important. Portfolio manager, of course, can be
16 improved. There are lots of other operational ratings
17 out there.

18 Lots going on with asset ratings, obviously in
19 California, in Massachusetts, at the Department of
20 Energy they're rolling out an asset rating tool.

21 They're also rolling out, at DOE, some IT
22 solutions that can make data collection easier for
23 jurisdictions.

24 And the last thing is we've seen about half of
25 jurisdictions that have policies include multi-family,

1 the other half do not. It's a tricky sector. There are
2 some things that I think have to happen to make
3 benchmarking really effective there, but it's something
4 that we have to begin to think about addressing because
5 it's a huge part of the real estate industry in the U.S.

6 So, with that I'll hand it back over to CEC and
7 thank you all very much for the opportunity to present.

8 MR. ASHUCKIAN: We have a few minutes for
9 questions or comments.

10 COMMISSIONER MC ALLISTER: I'd like to ask
11 Andrew one question. So, Andrew, are you still there?

12 MR. BURR: Yep.

13 COMMISSIONER MC ALLISTER: Oh, great. So, last
14 panel we talked about data and kind of the issues, a bit
15 of a minefield of issues of how to get the right data to
16 the right place, with kind of, you know, negotiating all
17 the different constraints.

18 And I'm wondering, you said the data for your
19 tool in New York came from ConEd. And I'm wondering if
20 you could describe the relationship or the discussions
21 that sort of led up to that?

22 MR. BURR: Well, you're talking about the owner
23 being able to access consumption data from utilities?

24 COMMISSIONER MC ALLISTER: Let's see, I'm not
25 remember what slide exactly, but you mentioned the data

1 came from ConEd and I was assuming -- well, maybe you
2 could just describe exactly what that data was?

3 MR. BURR: Sure. So, as I think a lot of people
4 understand, benchmarking requires the owner to have
5 historical energy consumption data for their buildings.

6 Owners of multi-tenant facilities do not have a
7 legal right to acquire that information without consent
8 from tenants. For owners with a lot of tenants in their
9 buildings this is obviously a huge hurdle for them to be
10 able to benchmark.

11 So, we're seeing a lot of jurisdictions working
12 with utilities and regulators to try and figure out a
13 way for utilities to get owners this data in a way that
14 protects privacy, but in a way that allows the owner to
15 benchmark.

16 So, a lot of the utilities are now aggregating
17 monthly consumption, they're wrapping up all the meters
18 in a building and providing a single number to the
19 owner, stripping it of identifying information from
20 individual tenants.

21 And in an increasing number of places we're
22 seeing that sort of pass muster with the utilities and
23 with the commissions. Does that make sense?

24 COMMISSIONER MC ALLISTER: Yeah, great, thanks a
25 lot. I was a little off base in my remembering what you

1 were actually saying there. But yeah, that's useful,
2 thanks very much.

3 MS. BROOK: I have a question, Andrew, this is
4 Martha Brook.

5 MR. BURR: Hi, Martha.

6 MS. BROOK: Your summary of U.S. disclosure
7 programs, it seems like the focus is in large commercial
8 buildings. Is that also true in Europe or are they
9 implementing either operational or asset ratings in
10 small commercial buildings?

11 MR. BURR: Oh, it covers small commercial in
12 Europe. I can't remember the threshold, but it's a
13 large part of what's covered there.

14 MS. BROOK: And are those operational ratings,
15 asset ratings or both?

16 MR. BURR: It typically, according to the IEA,
17 it's typically asset ratings for small commercial and
18 residential. And you only get into operational ratings
19 in Europe typically with the very large commercial
20 buildings and with government buildings.

21 MS. BROOK: All right. Okay, thank you very
22 much.

23 MR. ASHUCKIAN: Yeah, we have time for more
24 questions if anybody else has questions.

25 If not, let's move on to panel two.

1 MS. BROOK: Thank you, Andrew.

2 MR. ASHUCKIAN: Thank you, Andrew.

3 MR. BURR: Sure, thank you.

4 MR. ASHUCKIAN: So, do we have all our panelists
5 up? I think we're missing -- oh, we've got one on
6 WebEx. Okay, sorry.

7 MS. BROOK: Okay, so here we are back from
8 lunch, back from that presentation from Andrew Burr, and
9 we're going to talk about tools for commercial
10 buildings. And they vary, you know, the topic of tools
11 is varied and covers a lot of ground. So, you know, the
12 panelists that are going to talk to us cover that scope,
13 I think, pretty well, all the way from benchmarking
14 tools like we just heard about from Andrew to, you know,
15 sub-metering disaggregation tools to identify, you know,
16 performance based on whole building analysis, monitoring
17 and sub-metering tools to identify opportunities for
18 improvement, so, a large range here.

19 And again, just as this morning, we asked our
20 panelists to introduce themselves and address a couple
21 of the questions from the panel in a seven-minute time
22 frame.

23 And our first panelist is Alecia Ward, and I'm
24 going to introduce each of you, first, and then ask you
25 to speak.

1 Alecia is the Director of Government Relations
2 and Business Development at the Weidt Group, a 35-year-
3 old energy and software consulting firm.

4 She's an expert on energy efficiency,
5 sustainability and climate, and she has knowledge and
6 insight into the process of designing, deploying,
7 managing and evaluating energy efficiency, demand side
8 management, demand response from renewable energy
9 programs.

10 She has served at the pleasure of two members of
11 Congress and one President, and has coordinated
12 extensively with Federal agencies and state and local
13 governments.

14 Alecia maintains active relationships with more
15 than 40 state agencies, departments, bureaus, boards and
16 commissions, including the Energy Commission and the
17 California Public Utilities Commission.

18 MS. WARD: Thanks Martha. Thank you for the
19 opportunity to be a part of this panel. And, more
20 importantly, a part of this two-day workshop because I
21 think you're sort of addressing really challenging
22 questions.

23 And I approach this from a policy perspective;
24 the Weidt Group approaches it from a tools and software,
25 and energy consulting perspective.

1 And I think, as Mr. Schmidt said this morning on
2 the residential side, that it really is a perfect storm
3 right now.

4 So, in order to accomplish the goals of both AB
5 758, and AB 32, and 1103, and the State of California,
6 and the CEC, and the CPUC, and the Better Buildings
7 Initiative and all of the other initiatives that are out
8 there that are really reaching towards that Architecture
9 2030 Net Zero glide path I think there are some really
10 interesting questions around the issue of tools, and
11 building performance, how to track it and measure it,
12 provide an infrastructure for it, data warehouse for it,
13 and then use that data in order to inform better, more
14 effective policies, programs and implementation of those
15 two things.

16 So, the Weidt Group, a little bit about us is
17 that we have pretty extensive expertise in both
18 designing and deploying whole building demand side
19 management programs.

20 We run Energy Design Assistance, which is a
21 commercial new construction program that gets about a 30
22 percent savings beyond baseline code, with about a 70
23 percent market penetration, and have consistently done
24 that through about seven different baseline code
25 changes.

1 That's great, but it's also one of the more
2 expensive programs in a portfolio to be able to deploy
3 energy modeling on a per-building basis. It's labor
4 intensive and it has a lot of work-arounds. When you do
5 an energy model you've got to work around, and so you
6 get a variety of different methodologies for how
7 different people work around those issues.

8 As a result of our experience in that industry,
9 we decided that we would begin to take all of the
10 protocols that we've been doing on an ad hoc basis for
11 the delivery of these kind of programs and embed them
12 into software tools and protocols so that you could
13 effectively take that quality, and consistency, and
14 methodology for energy modeling and make it available to
15 the masses, without making it as expensive.

16 So, I've been asked to address two questions.
17 One is question number 24, "How can energy performance
18 tools be used successfully in the multitude of
19 nonresidential business cases?"

20 And then, "What's the proper role of public and
21 ratepayer funding?"

22 And I will tangentially sort of talk about the
23 appropriateness of requiring performance ratings.

24 So, let's step back for a second, though. the
25 purpose of identifying performance tools is to figure

1 out how to track the performance of that building.

2 But before we get to the larger portfolio of all
3 the buildings in order to be measured, in order to reach
4 the goals of AB 32 and AB 758 let's talk about
5 individual building. What do you want to do in an
6 individual building?

7 You want to design in as much efficiency as
8 possible, as you can, on the front end of that in the
9 pre-design and the design phase. You want to ensure
10 that that efficiency gets fully realized in the
11 construction documents, in the design documents, and
12 then it gets actually constructed and implemented in the
13 building.

14 You want to shore that up by demonstrating that
15 it is code compliant and, as possible, as an asset
16 rating that meets with the minimum requirements of the
17 State.

18 You want to dump all that detailed information
19 that you have about a new building into a benchmarking
20 system, so that what you've garnered in the process of
21 creating that depth of information for that building,
22 all those intensive inputs that went into the energy
23 models and simulations, that is not lost.

24 Currently, that information just gets lost out
25 in the universe. We need to find a way to capture it

1 and pull it through the entire lifecycle of that
2 building and then calibrate back to it for benchmarking,
3 for retro-commissioning, for deep retrofit opportunities
4 throughout the entire lifecycle of that building.

5 That's what I think is really important from a
6 policy perspective and what our organization tries to
7 make tools that will allow us to do.

8 So, the only way I can talk about the benefits
9 of these tools is to sort of describe for you the kind
10 of tools that we've built.

11 So, while traditional design intervention
12 programs accomplish these pretty dramatic savings,
13 energy modeling and the design intervention is labor
14 intensive and costly.

15 Everyone models, but not very many people want
16 to build models, and most of them just want to know what
17 the answer is that a model would give them in order to
18 make better design decisions or better operational and
19 performance decisions.

20 So, consistent, accurate results require
21 judgments, and good assumptions, and rigorous
22 organization, and deep expertise in building science,
23 and that's difficult to capture.

24 So, building energy performance tools have this
25 potential to capture all those things that are currently

1 varied in the marketplace in terms of their abilities,
2 in terms of the resources that are out there, and in
3 terms of things that currently sit on laptops and CPUs
4 that could otherwise sit on broader platforms, like
5 Online Access, that would make them more accessible,
6 readily available, capable of being data warehoused.

7 So, that's sort of the filter. So, what are the
8 trends?

9 The trends in the industry around modeling, and
10 around tools, specifically, is that you want flexible
11 modeling systems. You want to intelligently ask the
12 user to provide some minimum amount of data that can
13 result in a good model.

14 You want to accurately and securely embed and
15 then consistently apply key protocols for evaluation
16 parameters.

17 You want to provide context-sensitive inputs
18 where the user doesn't have, necessarily, access to the
19 information and derivation should be consistent and
20 repeatable over time.

21 You want to provide a consistent process that
22 derives and runs models, and a few hundred parametric
23 variations at a time and you want to enable everything
24 through a web interface.

25 The question is how can we build a reality like

1 that given the regulatory constraints that we all have,
2 and the historical legacy of the kinds of programs and
3 the way we've done this in the past?

4 I think the way that we begin to answer that
5 question is to talk about a couple of tools. One is a
6 tool called Net Energy Optimizer. So, whereas we do
7 energy design assistance, which is very similar to the
8 Savings By Design Program in California, we basically
9 said, that's great, but it only works for people who can
10 afford a \$15,000 energy model and have a really big
11 building, or project that's in a relatively large urban
12 area.

13 So, how do you make that accessible?

14 We've created a tool called Net Energy
15 Optimizer. It's an assisted self-service, with an
16 integrated design simulation tool that's done over the
17 internet, and it's intentionally targeted for buildings
18 that are as small as 5,000 square feet.

19 And it potentially has some applicability in the
20 1,000 to 5,000 square feet.

21 Because I noticed on your presentation this
22 morning that that's where really the bulk of that, in
23 the commercial marketplace, that challenge exists.

24 The beauty of this tool is that it dramatically
25 reduces the price point because it brings energy

1 modeling to a community of people who previously
2 wouldn't have been able to afford that in terms of
3 either making deep retrofit decisions or new
4 construction decisions.

5 So, finding a way to codify it, create it,
6 standardize it and make it accessible to people is what
7 we really struggle with and what we hope this process
8 that you've begun will move towards.

9 Second tool, it's called SB2030. It stands for
10 Sustainable Buildings 2030. It's a design tool
11 calculator that we built for the State of Minnesota, who
12 made a commitment to the goals of Architecture 2030.

13 However, a design community team doesn't really
14 know what a 60 percent emission reduction is off of
15 baseline design, so they need a tool to help them do
16 that.

17 So, the calculator leverages about 30 years of
18 data mining experience from real building simulations.
19 It intelligently estimates some of these building
20 parameters around the materials, the internal
21 organization of space types, building shapes and
22 orientation.

23 And the users are asked for a minimum amount of
24 data. So, if you don't know very much when you're
25 starting to use this building, you use all the defaults

1 that are embedded in the system.

2 As you know more, you come back to the system
3 and you enter more details on the specific data.

4 As you enter more it saves those simulations and
5 then allows you to operationalize the performance of the
6 building once you have consumption data on the back end.

7 This tool of the State of Minnesota is
8 effectively the first operational asset rating --
9 operational rating that holds asset constant, basically,
10 and it has a label and is currently being disclosed for
11 all public facilities in Minnesota.

12 MS. BROOK: You've been blinged, by the way.

13 MS. WARD: How long does that mean?

14 MS. BROOK: That means that you're out of time
15 and you should wrap up.

16 MS. WARD: Okay, I'm going to wrap up. So,
17 there's another tool for co-compliance. So, instead of
18 taking dead art, which is the code that we've got and
19 putting it into, you know, code books and doing look-up
20 tables, why wouldn't we have online, real access
21 available for people to be able to do capacity building
22 among the A&E community and then code officials being
23 able to effectively reduce the amount of on-site
24 checklists that they have to have.

25 The role of public funding in all of this I

1 think falls very similarly to emerging technologies,
2 measurement and verification, and other things.

3 We intentionally set aside a percentage of the
4 portfolio to be able to invest so that we can build the
5 pipeline to continue to drive more savings through the
6 system.

7 That similar methodology should be applied to
8 sort of the enabling infrastructure and the backbone of
9 these kinds of software tools that will standardize,
10 replicate, and then consistently provide some process
11 out in the marketplace that people can reliably resort
12 to.

13 Because as we look at codes, beyond codes,
14 performance-based codes, outcome-based codes, asset
15 ratings, operational ratings, DSM programs and their
16 intervention moments there's a huge sort of set of
17 policy things that are getting snagged all together
18 that we have to parse out.

19 And common platforms, like software that's
20 enabling this, should be able to help us do that.

21 MS. BROOK: Great. Thank you, Alecia, very
22 good.

23 All right, our next panelist is Denny Mann.
24 Denny is the President of Service at Marina Mechanical
25 and has been part of their organization for more than 30

1 years. I'm not going to speak about what I talked about
2 earlier in terms of my lack of imagination being with
3 the Energy Commission for over 20 years. I'm sure you
4 have more imagination than I do, Denny.

5 He has 32 years of experience in HVAC control,
6 service and maintenance. In addition to his technical
7 training and background, Denny has a deep understanding
8 of total environmental asset management, the team
9 approach to system maintenance.

10 He views systems as an asset and uses
11 preventative maintenance to maximize asset life,
12 efficiency and performance.

13 Recently, Denny's been working with the Western
14 HVAC Performance Alliance, Southern California Edison,
15 PG&E, and PECO on operationalizing the ASHRE ACCA
16 Standard 180 for Quality Maintenance.

17 Denny.

18 MR. MANN: Thank you. So, I've been asked to
19 respond to questions 24 and 26.

20 As a mechanical contractor, we're in San
21 Leandro, and our focus with our business has been to
22 grow the business through maintenance contracts.

23 And one of the things that's been in this
24 industry that's affecting the efficiency part of it is
25 just the economics of the times. One of the first

1 things folks always cut is the maintenance. And the
2 other thought is, well, we can go and change filters
3 ourselves and, you know, blow out condensate line, and
4 really don't have an understanding of the impact of
5 proper maintenance on the equipment.

6 And, you know, so this QM program, we're talking
7 about something that ASHRAE and ACCA got together and
8 said we can build these wonderful buildings, and these
9 phenomenally efficient air conditioning units and all
10 that, but once it's up on the roof, if it's not
11 maintained a year down the road, two years down the
12 road, all those wonderful things that were done on the
13 front end have gone by the wayside.

14 And so we've spent a lot of time trying to work
15 on, you know, the educational piece to the customer.

16 Our customers are technically under a hundred
17 thousand foot. Again, we like to sell maintenance
18 contracts and typically over a hundred thousand foot
19 they'll typically have some type of facility folks on
20 staff, so that's kind of not our target.

21 But the challenge in the under a hundred
22 thousand foot is typically property managers, owners
23 aren't necessarily involved in peer groups and that type
24 of thing, BOMAs and that, where they get that education
25 piece so they have a better understanding of the value

1 of keeping the equipment running efficiently.

2 So, that's where we kind of come in and try and
3 change the relationship from a contractor to a solutions
4 provider, an educator on the energy component.

5 Fortunately, in our industry there's been a lot
6 of changes over the last five years when it comes to
7 tools that you can implement that are more cost
8 effective, that allow us to go in and look at a building
9 24/7 for a week, so we can see what's happening on the
10 weekends, evenings when there's not a service technician
11 around.

12 And there's a phenomenal opportunity there just
13 on what we'll call low-cost/no-cost opportunities, time
14 of day schedules. You know, why is the unit coming on
15 at 3:00 in the morning? Well, I didn't want it to be
16 cold when the clients came in, or the customers came in,
17 the tenants came in.

18 Well, actually, in reality it only took an hour
19 and a half to come to temperature. So, you know, those
20 types of things.

21 In the smaller commercial buildings probably the
22 number one issue with efficiency is economizers that are
23 non-operational. And I would venture to bet that
24 somewhere in the neighborhood of 60 to 70 percent of
25 economizers are non-operational.

1 And in the San Francisco Bay Area that's just a
2 shame, there's such a wonderful opportunity for free
3 cooling, if you will, by having functional economizers.

4 And one of the issues that we've dealt with over
5 the years is different types of tune-up programs that
6 have come through, whether it's an Air Care Program, a
7 Check Me Program, these types of programs. One issue
8 has been it's a once in three-year deal. So, you go in
9 and you do your tune-up and that building's not eligible
10 again for three more years.

11 Well, if that equipment's not being maintained
12 during that three years, it's no wonder that we haven't
13 seen the results that everybody's looked for by doing
14 these tune-ups.

15 And again, one of the tools for the legislative
16 side is this QM Program, the 180 Program that requires
17 once you do the tune-up on the equipment, on the front
18 end, you then -- the customer has to agree to a three-
19 year maintenance contract on that equipment to make sure
20 it's maintained at that level.

21 As far as going into requiring all buildings to
22 get rated, I think that's phenomenally important. One
23 of the things that we do when we're talking to a new
24 customer is go in and offer to do the Energy Star rating
25 on their building, if it hasn't been done, and probably

1 90 percent of the time it hasn't.

2 Because it gives us an opportunity to go in and
3 let's say the building comes back at a 60, and you can
4 talk to them about taking that building, say, from a 60
5 to a 65, a 60 to 70, or maybe try and get to the Energy
6 Star at 75. And in dollar and cents say this is what it
7 would look like if you made that leap from here to here.

8 And a lot of the times you can make that five-,
9 ten-point leap, again, with kind of those low-cost/no-
10 cost, and with those savings be able to do a quality
11 maintenance on the building so that you can make sure
12 that the building stays running efficiently.

13 Kind of the next level is this ongoing
14 monitoring. I think that's really important because,
15 again, you know, from the economizer stand point,
16 whether we're looking at demand control ventilation --
17 every building, basically, that we've done studies on
18 has been over ventilated. I mean and not just a little
19 over ventilated, a lot over ventilated.

20 So, if you're trying to condition 100-degree
21 outside air in the middle of the summer, rather than 75-
22 degree coming back from the building, that's a huge
23 energy spend that's very easily avoidable with
24 relatively easy demand control ventilation.

25 So, that's a big thing going on.

1 Variable speed fans, for years the small, call
2 it 25-ton and under package equipment's typically just
3 been a constant speed. So, whether there's a call for
4 heating or a call for cooling, or you're just in a
5 ventilation mode that fan's running at a hundred
6 percent.

7 So, that's one of the technologies that's come
8 out. More folks have come up with ways to put VFDs on
9 the motors, integrate the VFD with the outside air so
10 that as you slow the fan down, if you didn't do anything
11 with the outside air dampers, your ventilation rates go
12 down because you've slowed the fan down.

13 So, now they'll integrate that and go, okay, if
14 I slow the fan down to save some energy, then I need to
15 open up the dampers a little bit more to bring in the
16 required amount of outside air. Demand control
17 ventilation tied into the same component.

18 And then from a technology stand point, the
19 biggest user in air conditioners has always been the
20 compressor. So, ideally, you have it off for the
21 greatest amount that you can through economizer modes.

22 But even in the compressor arena there's been
23 huge strides as far as, again, for years, constant
24 volume. A compressor was either on or it was off. If
25 you had a ten-horse compressor and you had a two-ton

1 load, you're running a ten-horsepower compressor.

2 So, now, they're doing variable speed
3 compressors that make a huge difference.

4 One quick story, we did a test in the City of
5 Walnut Creek, had a 40-ton unit, four 10-ton compressors
6 on the unit. So, if you had a 2-ton load you brought on
7 ten tons worth of compressor.

8 If you had a 12-ton load you brought on 20 tons
9 because you've got 10-ton increments.

10 And what we did is we took one digital scroll
11 compressor, so variable flow through the compressor,
12 replaced one of the compressors with that one, and that
13 one will stage at 1-ton increments.

14 So, now, you can go with 1-ton increments, from
15 1 to 40, rather than 10-ton increments.

16 And so it's those type of technologies that are
17 really driving the -- I'll call it going into existing
18 buildings with existing equipment, and having ways that
19 you can raise, if you will -- or lower the energy span
20 on that equipment.

21 MS. BROOK: Great, very good. Thank you, Denny.

22 Our next panelist is Karl Brown. Karl is the
23 Deputy Director of the California Institute for Energy
24 and the Environment and the Director for CIEEs Energy
25 Use and Buildings Program.

1 He also directs the State Partnership for Energy
2 Efficiency Demonstrations, the SPEED program sponsored
3 by the California Energy Commission, Research and
4 Development Division.

5 For his contributions to UC, energy efficiency
6 planning and implementation, Karl has been honored as
7 the 2003 Energy Engineer of the Year by the Association
8 of Energy Engineers Bay Area Chapter, and as 2010
9 University of California's Sustainability Champion.

10 He helped found and continues to advise the UC
11 California State University Investor-Owned Utility
12 Energy Efficiency Partnership Program.

13 Karl.

14 MR. BROWN: Thank you, Martha.

15 Today I'm going to address question 24 and I'm
16 going to talk about --

17 MS. BROOK: There's a little panel in front.

18 MR. BROWN: I got it. Today I'm going to
19 address question 24, I'm going to talk about metering as
20 an energy performance tool in itself.

21 Question 25, I'm going to present an example of
22 a successful program focused on metering.

23 And question 27, I'm going to present some
24 context for that question giving the current landscape
25 for monitoring.

1 So, I'll start with a very simple statement,
2 metering saves energy.

3 Now, energy metering often works as a critical
4 tool in energy management strategies, including
5 commissioning and retrofit components. But energy
6 metering is also sometimes effective as a stand-alone
7 tool in reducing energy use by alerting building
8 operators, owners and even occupants to energy waste.

9 Energy waste problems that, once identified, are
10 better understood through monitoring are trivial to fix.

11 I'll give a couple of examples. The first one
12 is from the University of California, at Berkeley
13 campus, which has recently started an incentive program
14 for departments to save energy in their buildings. And
15 a key part of that program is the provision of energy
16 dashboards in dozens of the larger buildings.

17 And so you can now read in the Berkeley Campus
18 Newsletter about measures that have been identified by
19 students and faculty in the buildings to save large
20 quantities of energy.

21 As an example, a large fan was left on as a part
22 of a renovation and not put back under automatic
23 control. That was flagged by someone using one of these
24 dashboards and then remediated by the maintenance
25 department.

1 The second example comes from the most common
2 type of heating ventilation and air conditioning system
3 in use today, VAV reheat systems.

4 One way in which VAV reheat systems can commonly
5 fail is with a stuck open chilled water valve. Now,
6 this is sort of a silent failure because the reheat
7 kicks in and keeps the spaces comfortable. But this is
8 in no way a graceful failure because this is wasting an
9 enormous amount of energy.

10 So, this is a problem when building owners and
11 operators know about it, they are going to go fix it.
12 But the issue is knowing about it and metering is the
13 key step for that.

14 The third example is from a California campus
15 where an energy management strategy was being employed
16 involving taking chilled water from a district chilled
17 water system and the strategy was to try to minimize the
18 use of chilled water in that building. Sounds
19 promising.

20 Meter revealed that reducing the use of chilled
21 water in the building caused the fan systems in the
22 building, which are capable of using a lot more energy
23 to overreact and be on full power all the time, over
24 ventilating.

25 And once metering revealed that this strategy

1 was not the optimal strategy, the campus went back to
2 using more chilled water, less fan power, and that was
3 \$60,000 a year, I think.

4 So, moving on to the next question, an example
5 where energy performance metering has been successfully
6 deployed and utilized at scale since 2004, in the
7 monitoring-based commissioning element of the University
8 of California, California State University Investor-
9 Owned Utility Energy Efficiency Partnership.

10 This has -- the successful deployment of
11 monitoring in this program I think led to third-party
12 programs which are now being deployed. And those third-
13 party programs were as proposed by private sector
14 consultants that served -- had experience serving the
15 campuses of the UC, CSU, IOU partnership.

16 Full documentation of that program can be found
17 in a paper that my colleagues Andrew Meiman, Mike
18 Anderson and I recently published in the proceedings of
19 the ACEEE Summer Study in Buildings for 2012.

20 Last, I will say that electricity metering is
21 becoming ubiquitous. In addition to Smart Meters, you
22 now find electricity metering coming in switch gear,
23 invariable frequency drives, and so the metering is
24 coming with the buildings. It's the software tools that
25 are the issue.

1 And so software tools to enable effective use of
2 energy metering data by building operators, owners and
3 occupants continue to emerge and are already being
4 employed by many.

5 However, effective use in small and medium
6 buildings will depend on mass market development and
7 access.

8 So, with regards to mass market development I
9 think there's a lot of room for public interest research
10 and other assistance to this industry, which is by no
11 means mature in that it really needs help in learning
12 where to collaborate and where to compete.

13 MS. BROOK: Perfect. You ended right at the
14 bling, I'm very impressed.

15 Lin, we're going to hold off with you for just a
16 second, we're going to introduce Mike first, and let him
17 speak. Even though he's not in the room, he still has a
18 presence on my agenda here.

19 So, Mike -- is Mike queued up?

20 Okay, Mike Kaplan is Vice-President of Marketing
21 at Retroficiency, Incorporated. Mike drives marketing
22 efforts for this company. It's software analytics of
23 Retroficiency enables energy service providers and
24 utilities to cost-effectively prioritize high potential
25 buildings and evaluate thousands of energy efficiency

1 measures in minutes.

2 Prior to Retroficiency, Mike was a strategy
3 consultant for CSMG, where he led dozens of market
4 opportunity assessments, business case development, and
5 investment, due diligence engagements for clients in the
6 telecommunications, wireless, and digital media markets.

7 Mike holds a BA from the University of Rochester
8 and an MBA from Massachusetts Institute of Technology's
9 Sloan School of Management.

10 Mike, are you online?

11 MR. KAPLAN: Thank you, Martha, and thank you
12 everyone for letting us to join, albeit remotely from
13 Boston today. We're excited to participate in this
14 phase of the workshop.

15 So, I'm going to be addressing primarily
16 questions 24, around how energy performance tools can be
17 implemented for success, and I'll briefly touch on
18 question 25.

19 So, in terms of successfully implementing energy
20 performing tools, I think the first thing that is
21 important to understand is that there are, as the other
22 panelists have touched on and alluded to, several
23 classes of energy performance tools. And each one
24 really varies in terms of cost, how scalable it is, the
25 type of data you might analyze, and the insights they

1 deliver.

2 You know, broadly speaking classes of these
3 solutions, as we see them, could include energy
4 dashboards that can provide real time or near real time
5 views of energy consumption and basic metrics, interval
6 analytic solutions where we provide -- Retroficiency
7 provides a solution that remotely assesses the
8 building's efficiency potential.

9 To on the other end of the spectrum, you know,
10 extensive hardware-based solutions that continually
11 monitor a building's systems.

12 So, I think it's important to really think about
13 deploying these tools, you know, in terms of getting the
14 right level of energy analysis at the right time, such
15 as the cost and effort required to deliver these
16 solutions that would really be dramatically lower than
17 the benefit that you're obviously achieving.

18 There are, as we see it, multiple phases of
19 driving efficiency. The first is really identifying the
20 buildings that you're going to target across a very
21 large building stock.

22 The second is really engaging those most
23 important buildings and those owners to secure and trust
24 in program participation.

25 And then, finally, you know, really evaluating

1 the building to determine the best measures to actually
2 implement.

3 So, early on in that identification process, you
4 know, when you're looking at thousands of buildings or
5 tens of thousands of buildings, the goal should really
6 be to focus efforts on those buildings with the greatest
7 potential.

8 We've analyzed a number of utility portfolios
9 and pretty consistently found that the top 35 percent of
10 buildings in those portfolios have about 75 percent of
11 the total savings opportunities.

12 So, it becomes very important to know which
13 buildings have that potential and which ones have less
14 potential.

15 Energy performance tools at that phase, whatever
16 you might implement, needs to be done quickly and
17 inexpensively.

18 And we think it's really important here to try
19 and leverage data, to the extent that's possible, from
20 meters that are already installed.

21 In particular, you know, interval data where we
22 focus, combined with advanced analytics, you know, can
23 really determine the true potential savings of a
24 building and the opportunities that exist without ever
25 even going on site.

1 And it's really, again, effective for
2 identifying the best buildings and engaging with those
3 buildings owners with the unique operational
4 opportunities or retrofit opportunities that exist in
5 the building.

6 Now, specifically, on the small- and medium-
7 sized building segment, you know, I think there are a
8 few considerations.

9 So, while it's important for all buildings, the
10 need to really deliver actionable insights to small- and
11 mid-sized businesses, buildings and business is really
12 critical. Because these buildings and building owners
13 often don't have the expertise to properly interpret
14 energy data and make corrective actions on their own.

15 The insights must be provided when you're
16 looking at a very large number of buildings in either,
17 ideally, a web-based or other digital formats at scale.

18 It's also important, you know, when you're
19 touching this amount of buildings to actually go into a
20 building, given the number of buildings and the
21 aggregate consumption for each, it's really important to
22 evaluate as many energy conservation measures as
23 possible when you're sending somebody, particularly on
24 site.

25 So, we strongly advocate for whole building

1 approaches to energy efficiency to achieve those deep
2 savings as possible.

3 Traditionally, in the small- to mid-sized
4 business there's been a lot of single-measure,
5 prescriptive programs such as lighting, because it has
6 traditionally been very costly to comprehensively
7 evaluate which UCMS were optimal.

8 So, emerging sort of audit platforms that
9 combine data analytics with rapid building modeling can
10 really evaluate thousands of measures in minutes to
11 determine what that optimal package of measures is in a
12 very comprehensive, standardized, and cost-effective
13 manner.

14 So, briefly, on question 25, I will just say
15 that energy performance tools really should be subject
16 to any of the same cost-effectiveness, you know,
17 requirements as any other efficiency program dollars,
18 such as, you know, an incentive, or funding for energy
19 audits, as well as being part of market transformational
20 initiatives.

21 And then, secondly, the first priority should
22 really be to leverage data from existing infrastructure
23 that has already been paid for by the ratepayer, you
24 know, such as Smart Meter, Smart Grid deployments.

25 That concludes my comments and thank you, happy

1 to take any questions.

2 MS. BROOK: Okay, Mike, thank you very much.
3 Hopefully, you can stick around a little longer, we're
4 going to open it up for questions after our last
5 panelist has his seven-minute session.

6 So, Lin Ortega is our next panelist. He's the
7 Utilities Engineer and Program Manager for the County of
8 Santa Clara's Facilities and Fleet Department.

9 Lin's current focus and management
10 responsibilities related to existing buildings include
11 responsibility for developing and managing about a \$60
12 million annual utilities budget.

13 This responsibility includes the planning and
14 implementation of costs and energy usage reduction
15 measures in the areas of energy efficiency, renewable
16 energy, water conservation, and utility purchasing
17 strategies.

18 Lin.

19 MR. ORTEGA: Okay, thank you.

20 I've been asked to address three questions, 27,
21 24, and 25 in that order.

22 Before I provide my responses, though, I did
23 want to give a little bit of background information on
24 the County of Santa Clara, because I think it will help
25 put my responses in perspective.

1 So, first of all, the County has over 10 million
2 square feet of space. Types of space range from office,
3 to prison facilities, garages, hospitals, clinics, and
4 just about anything in between.

5 So, in terms of vintage, we have building
6 probably from the 1800's up to fairly new buildings.
7 So, I think it's safe to say that we have a fairly good
8 salad of buildings, so to speak.

9 In terms of the program on the energy efficiency
10 side and the renewable energy, we've done quite a few
11 energy efficiency projects. We also have done quite a
12 bit of renewable power.

13 We've managed to secure over \$12 million in CSI
14 incentives on projects that we've completed, solar
15 projects that is. So far we've received almost two and
16 a half million dollars in CSI incentives.

17 In terms of energy efficiency, I think PG&E has
18 given us over a million dollars in incentives over the
19 last six or seven years, I would say.

20 In addition to that, some of these projects we
21 financed and over the last three years we've been able
22 to secure \$27 million in bonds, mostly qualified energy
23 conservation bonds.

24 I provide this information because in terms of
25 measuring the results of the projects that we've

1 completed, it is critical to us to be able to validate
2 our investments.

3 So, with that said, I'm going to start with
4 question 27.

5 The question reads, "Is it appropriate to
6 require monitoring equipment in certain types and/or
7 sizes of nonresidential buildings to improve the
8 persistence of public and ratepayer funded efficiency
9 improvements?"

10 My answer has to be yes. Measuring the results
11 of implemented efficiency projects, it needs to be an
12 integral part of the efficiency project, itself.

13 The data that comes from it helps validate the
14 reasons why the measures were implemented in the first
15 place.

16 And in addition to that and perhaps even more
17 importantly it helps to sustain the results of the
18 projects. If we cannot track it and measure it after
19 the implementation of the efficiency measures, some of
20 these tend to degrade or fail over a short period of
21 time.

22 If we are financing, and in our case, as I said
23 earlier, we are financing many of these projects, it
24 could be -- it could be a really big problem paying for
25 efficiency measures that are not producing.

1 So, it is a critical piece of energy efficiency
2 or it should be, in my opinion.

3 With the prevalence of Wi-Fi and landline
4 networks in and around facilities and the availability
5 of affordable measuring technology and software, it is
6 becoming more feasible now, in my opinion, to include
7 this feature as part of the efficiency projects,
8 particularly larger efficiency projects.

9 But with that said, in some of these projects
10 the added cost of including measuring technology could
11 very well put the ROI of the projects out of reach.

12 So, I'll touch a little bit more on this in one
13 of the following questions.

14 So, I'll move on to question 24, "How can energy
15 performance tools be used successfully in the multitude
16 of nonresidential business markets in the State? Can
17 these tools be cost-effectively deployed in small and
18 medium buildings?"

19 As I said, measuring technology is becoming more
20 and more affordable and readily available and so are the
21 communications protocols, Wi-Fi 33, land-based.

22 In addition to those communications protocols
23 there's also industrial protocols, like ZigBee, these
24 make it possible to deploy monitoring and control
25 technology in facilities more readily and easily and

1 with that make it more affordable.

2 However, in existing facilities there is the
3 challenge of where do we put these measuring devices or
4 control devices, for that matter.

5 For older facilities, and we have plenty of them
6 in the county, the buildings were designed and
7 constructed and really with construction efficiency in
8 mind. What is the best way to construct the building at
9 the lowest cost, not necessarily with the building's
10 post-construction operating efficiencies in mind.

11 So, that is a challenge that remains and that is
12 often the biggest cost factor in deploying measuring
13 technology, especially in existing facilities.

14 Ideally, all of these features would be included
15 in new construction or in the design of new
16 construction. Perhaps this is something that should be
17 included, and it may already be in the works in the
18 construction codes and the design codes that exist.

19 So, I will move on to question number 25, "What
20 is the proper role of public and ratepayer-funded
21 programs to increase the access to and penetration of
22 energy performance tools for nonresidential buildings?"

23 Until now, energy efficiency programs really
24 have focused on incentivizing the implementation of the
25 measures, themselves.

1 And in our experience, in the County, these --
2 if the calculated incentives -- or the incentives are
3 really calculated based on tests, sample tests. So,
4 this is what is used to really pay for the incentives.
5 It doesn't really represent the actual results.

6 As far as I know, there are no incentives,
7 really, that -- for the deployment of performance
8 measuring devices.

9 So, as far as the energy efficiency measures, in
10 order to sustain those, really, they must include some
11 form of measuring technology to be part of those
12 measures,

13 Like the California Solar Initiative Program,
14 public and ratepayer-funded incentive programs really
15 must develop a way to incentivize the deployment of
16 performance measuring technology.

17 I realize this is easier said than done, but one
18 of the ways that perhaps might work is some sort of a
19 tiered incentive approach where higher incentives could
20 be provided to efficiency projects that include the
21 deployment of measuring technology.

22 Or perhaps to efficiency projects implemented in
23 facilities that already have this technology deployed.

24 So, while the performance measuring tools may be
25 installed to measure the results of a specific project

1 or set of projects, the technology can be used for other
2 purposes, such as cost allocation, trouble shooting, and
3 peak demand management.

4 So, the benefits of measuring usage, I think
5 it's been stated time and time again here, in this
6 forum, but there are greater benefits than just
7 measuring the results of a specific energy efficiency
8 project.

9 From my perspective, it helps in developing
10 budgets. It helps in managing peak demand. It's also a
11 way for our operations folks to troubleshoot buildings.

12 And it's interesting, but being able to look at
13 real-time power on a second-by-second basis can really
14 tell the story as to what is wrong in a facility.

15 So, I think from my perspective, from a public
16 sector's perspective, being able to measure the power
17 consumption of a facility is very important, not only
18 for validating energy efficiency, but also for the
19 reasons that I mentioned.

20 I think because of that this is something that
21 really should be pursued and should be in the form of
22 incentives, perhaps, or perhaps subsidies, be looked at
23 more and perhaps find a way to deploy it somehow.

24 MS. BROOK: Great. Thank you, Lin.

25 All right, Commissioner McAllister, do you have

1 questions for the panel?

2 COMMISSIONER MC ALLISTER: I do, actually,
3 unless you want to kick it back to you, Martha, because
4 I think you probably have better questions than I would
5 have. But in particular because, you know, you're day-
6 to-day working in some of these -- in the nonres tool
7 kind of strategy and implementation, and so I think to
8 the extent that you and your staff, you know, colleagues
9 can -- you're probably in a better position to shape
10 this and sort of dig in than I am.

11 But I do have a couple of questions. One, you
12 know, the last speaker actually started to get into this
13 but, you know, energy efficiency at the facility level,
14 energy efficiency is part of a variety, kind of an
15 ecosystem of activities. You've got the facility
16 manager, an owner, whatever they're doing, and that
17 involves rate analysis, right, involves -- and the whole
18 economics of what the bill is going to produce each
19 more, and that's probably more real than the actual
20 energy, per se, to the customer or the consumer.

21 And we know that, particularly in Southern
22 California, and really throughout the State, demand
23 response is something that we really have to get our
24 heads around and it is very much related to energy
25 efficiency.

1 And so I guess I'm curious as to how your
2 experiences, if any of you have really dug into the
3 automation side of -- you know, metering is one step but
4 you can do lots of things with electronics, and metering
5 is one of them, and automation is another, and there's a
6 fairly robust, you know, set of technologies out there
7 to help do that.

8 So, I'm wondering sort of in your approaches if
9 you've gotten into not only the metering to inspire
10 performance, but also the actual control and automation
11 of that because it seems like it could come efficiently
12 all together if one were to take an integrated look at
13 the building.

14 MR. ORTEGA: Yeah, I'll touch briefly on that.
15 We do have experience participating in auto DR. That
16 program we started about three years ago, under PG&E's
17 auto DR program. And we retrofitted several of our
18 facilities, those that required technology improvements
19 to participate in it.

20 We already had sub-meters deployed through all
21 our facilities. About ten years ago we started
22 investing in sub-meter technology through all our
23 facilities.

24 It's mostly to address accounts that have
25 multiple buildings tied to them. So, we didn't -- even

1 with that investment and we invested over a million
2 dollars in sub-metering technology, but even with that
3 we didn't -- we still don't have the granularity that we
4 need.

5 Going back to your question on auto DR, one of
6 the key ingredients, really, to be able to do that and
7 participate in those programs is, in fact, being able to
8 measure technology or measure the energy on a real-time
9 basis.

10 We were fortunate that we had sub-meters in most
11 of our buildings. We actually rolled in 16 of our
12 largest facilities into that auto DR program. Not only
13 could we measure the energy consumption of each one of
14 those buildings, but we also tied the meters -- I guess
15 also tied them to PG&E's -- I forget the name of the
16 technology that we were using at that time, but we also
17 tied our meters to -- and our control ENS systems to
18 respond to the signals of PG&E.

19 But even with PG&E's signals not being there, in
20 order words when they didn't call for a peak demand
21 period, we can still utilize those to manage our peak
22 demand, regardless of whether or not there's an event
23 called for under auto DR.

24 So, yes, it is very useful for that. I didn't
25 get into the details, but that was one of the main

1 reasons I mentioned auto DR.

2 COMMISSIONER MC ALLISTER: That's really good
3 stuff and I mean I think you could actually extend it to
4 DG. And, you know, at the individual customer level
5 it's not too far off that you could actually have
6 arbicharge going on, or some kind of -- you know, if you
7 had storage on site and things like that. We're moving
8 towards all that very quickly.

9 And I think, you know, leveraging these
10 various -- 758 has a particular focus, but it's not a
11 big stretch to sort of envision it helping to lay the
12 ground for -- or actually being the forum for a broader
13 discussion on, you know, what kinds of equipment would
14 go in buildings, right.

15 So, anyway, I kind of want to see if anybody has
16 comments on how that might look or your own experience
17 along those lines. So, thanks for that, Lin.

18 MS. BROOK: So, Karl or Denny would you want to
19 speak to automation in your -- in the building projects
20 that you've been involved in? I mean very different
21 buildings, right, campus buildings for Karl, and I would
22 characterize maybe small and medium commercial buildings
23 for you, Denny. I mean there's probably a big range of
24 automation technologies that you're seeing in these
25 buildings, either incented or just through your business

1 practices.

2 And that, I think, maybe would complement what
3 Lin was saying about the Santa Clara buildings.

4 MR. MANN: Yeah, for myself, I would probably
5 say, you know, 90 percent of the buildings that we do
6 that are under the 100,000-foot do not have any type of
7 BMS system in there. Which is why I think some type of
8 monitoring or ongoing monitoring is even important in
9 those buildings as far as not having a BMS system where
10 they can look at any trends or that type of data.

11 Again, as the costs for those types of systems,
12 now there's these new systems that are coming in, that
13 aren't really a full blown BMS system that still give
14 you a lot of the same benefits that you can get from
15 those systems.

16 And as that price point comes down, I think
17 we're going to get those into buildings with less square
18 footage.

19 MS. BROOK: Oh, great. Okay.

20 COMMISSIONER MC ALLISTER: Go ahead. Sorry, go
21 ahead.

22 MR. BROWN: In terms of automation, I want to
23 defer to my colleagues at the Demand Response Research
24 Center at Berkeley Lab.

25 MS. BROOK: Okay, that's fine.

1 MR. BROWN: I will say that --

2 MS. BROOK: That's where we got Lin, by the way.
3 That was our recommendation.

4 MR. BROWN: With demand response I do notice
5 that we find a lot of things that can be permanently
6 implemented as energy efficiency measures, and then you
7 go on to find more demand response.

8 MS. BROOK: Right.

9 MR. BROWN: And those measures are often on
10 peak, so there's a lot of savings to be had on peak.

11 MS. BROOK: Uh-hum, good.

12 COMMISSIONER MC ALLISTER: The other question I
13 had was really, specifically for Denny, probably.

14 Now, are you finding that your expertise in
15 maintenance and the use of data to streamline
16 maintenance and improve the quality gives you a cost
17 advantage or kind of a price advantage in the
18 marketplace, in some way, or allows you to be more
19 competitive when you're, say, responding to an RP or
20 looking for new customers?

21 MR. MANN: Yeah, I think for us what it's been
22 is a differentiator from other contractors that aren't
23 providing that level, if you will, of engaging the
24 customer in how their building's using energy.

25 That whole education piece I think is critical

1 to helping them make the best business decisions they
2 can.

3 So, we really look at it as a differentiator and
4 it really does help us working through projects that
5 maybe typically they wouldn't do because they're just
6 looking at that front-end cost, rather than looking at
7 the bigger picture of what it's costing them not to do
8 the project.

9 And so we try and work on kind of changing their
10 mindset, if you will, on getting past that front-end
11 cost and looking at the bigger picture.

12 COMMISSIONER MC ALLISTER: Great, thanks. So,
13 I'm going to turn it over to Martha.

14 MS. BROOK: I think how you described your kind
15 of evolution in your business from a contractor to a
16 service provider was a perfect kind of capsulation of
17 the change in business practice, which was awesome, it
18 was great.

19 COMMISSIONER MC ALLISTER: Yeah, that's good
20 stuff. So, I will turn it over to Martha and anyone
21 else who wants to comment.

22 MS. BROOK: Great, thanks. Do we have any
23 comments?

24 MR. ASHUCKIAN: Yeah, we have a -- well, we have
25 one question here and actually had one from the web,

1 that it's specifically on a different question, but I
2 think actually may be appropriate for this panel.

3 It's, "are there special strategies for reducing
4 energy use in the retail sector?"

5 And I just wonder if anybody might be able to
6 address that?

7 MS. BROOK: Anybody? Anybody?

8 MR. MANN: Retail customers, I'll use what was
9 Long's Drug Stores, it's now the CVS's on there.
10 Typically, those fell under this whole -- when I was
11 talking before about cutting back on maintenance. And,
12 you know, unfortunately, that's one of the areas in
13 retail where they've really been hit real hard. And so,
14 again, maintenance goes back to that.

15 CVS, for what it's worth, doesn't do
16 preventative maintenance on their equipment. Their
17 business model is run to fail. You know, a lot of the
18 CVS stores, traditionally, were kind of -- their
19 footprints were all the same.

20 Well, then they brought in the Long's
21 Drugstores, which are 30-, 40-year-old buildings and now
22 they're having issues with it.

23 With that said, the pharmacies are the most
24 critical part for them. So, you know, the one thing
25 they do invest in is keeping the pharmacies, you know,

1 with the temperature within the guidelines of that.

2 But retail has been really hard hit and CVS
3 isn't the only one that uses a run-to-fail policy, but
4 that is their policy on 6,000 locations.

5 MS. BROOK: Wow. Wow, okay. Do you have any?

6 MS. WARD: I might just answer that from a
7 pretty high level perspective, which is, you know, one
8 of the tools is this B3 benchmarking tool, and given
9 Andrew's talk about the role of benchmarking and how it
10 plays, what's critically important is as these tools get
11 put in place, and as rating, labeling, and disclosure,
12 and then programs begin to sort of pick up those low-
13 hanging fruit opportunities at retail establishments or
14 any other space use that's not currently captured in the
15 current dataset of comparison tools.

16 So, like CBECS is an excellent resource, but it
17 has a sampling problem which doesn't represent 70
18 percent of the buildings in the marketplace.

19 MS. BROOK: Uh-hum.

20 MS. WARD: CEUS, you guys did a much better job
21 over-sampling in the California market.

22 CBSA, the northwest version of over-sampling in
23 that area.

24 But there's still a pretty large percent of the
25 buildings that don't have a reference case. And in that

1 case simulations are really the one way to begin to
2 build together this space use.

3 We do a lot of work on convenience stores,
4 retail spaces, grocery stores and other things. And I
5 thing that as you begin to narrow down from our
6 population of buildings, either at the sort of owner
7 level of those retail chains, or at the State level as
8 you're beginning to make priority choices of limited
9 budgets, that's important to get the reference cases
10 right.

11 And, that retail is a particularly difficult and
12 challenging one because that retail encompasses so many
13 possible other drill-downs of silo to activities on a
14 space usage basis that are going on in that facility.

15 MS. BROOK: Uh-hum.

16 MS. WARD: So, you know, we'd like to have that
17 conversation and help sort of drill down on what are
18 consistent and replicable opportunities to classify
19 like-to-like buildings in order to be able to better
20 target the DSM programs and to better target the
21 benchmarking so that those sorts of segments of
22 buildings don't get treated badly when the disclosure
23 requirements come out.

24 MS. BROOK: Right, right, good. Good point.

25 Do we have another question, Dave?

1 MR. ASHUCKIAN: Yeah, I just wanted for the
2 record that that was the question from Tracy Von Lone,
3 from Glumac.

4 And George Nesbitt has a question for this
5 panel, CalHERS.

6 MR. NESBITT: Thank you. Nonresidential
7 buildings, it's funny we talk about motels and hotels --
8 motels -- I'm sorry, high-rise multi-family, which are
9 residential occupancies.

10 You know, and then in the codes portions of the
11 residential portion fall under residential codes,
12 portions of it actually fall under nonresidential codes.

13 And I've done some modeling of multi-family, and
14 I've taken the same building and run it as a low-rise,
15 and as a high-rise, in a non-air conditioning climate.
16 As a low-rise, it's a heating-dominated building. You
17 call it a high-rise, the same inputs, it becomes a
18 cooling-dominated building. And these are buildings
19 that have no air conditioning.

20 So, we're calling high-rise multi-family
21 nonresidential buildings, we're calling them cooling-
22 dominated buildings, we're doing cooling-dominated
23 measures to get -- to reach code or get savings, yet
24 they have no air conditioning, and we're actually
25 increasing heating energy.

1 MS. BROOK: Are you complaining about our
2 compliance software, is that what you're doing? I'm not
3 sure.

4 MR. NESBITT: You know, this is tools for
5 nonresidential buildings so, you know.

6 MS. BROOK: Okay.

7 MR. NESBITT: You know, other things are -- air
8 leakage doesn't matter in nonresidential buildings
9 according to our energy modeling and we don't have
10 things like quality insulation. Yet, every
11 nonresidential building I've ever stepped foot onto,
12 they install insulation as poorly as we do in
13 residential.

14 As I said yesterday, you know, I'm fighting with
15 a mechanical engineer, he doesn't know what a room-by-
16 room load calculation is or an ACCA Manual D. I'm
17 redoing his working. A, proving his work was not a real
18 design, and trying to guide him to show him how to do
19 it.

20 So, in nonres we have as many issues with
21 quality and things not -- A, not being designed right.

22 MS. BROOK: Uh-hum.

23 MR. NESBITT: B, not being installed right. And
24 then we don't have the commissioning, or retro-
25 commissioning. And, you know, when we look at the data,

1 you know, we know that you have a brand-new building and
2 some of them perform really well, and a lot of them
3 don't. And, you know, it's design, installation, and
4 commissioning.

5 So, we know how to build, we know how to
6 retrofit more energy efficiently. We know the answer,
7 it's how to do it.

8 So, I'm just, you know, hitting on issues and I
9 like to be consistent and repeat it, and finally,
10 hopefully, it sinks in and maybe we do something about
11 it.

12 MS. BROOK: Okay. It's going to take a few more
13 times, but not today.

14 MR. NESBITT: Yeah.

15 (Laughter)

16 MS. BROOK: Often. Early and often, right.

17 MR. NESBITT: It's preventive maintenance.

18 MS. BROOK: Okay, Karl wants to respond and he's
19 got 58 seconds to do so.

20 MR. BROWN: Modeling has its strengths and
21 weaknesses, and to support its weaknesses is one of the
22 best reasons to do a lot more metering and monitoring.

23 But what that really is is feedback.

24 MS. BROOK: Uh-hum.

25 MR. BROWN: Feedback from actual operation of

1 buildings back into the design and modeling and
2 construction. And, you know, all those feedback loops
3 are broken, we need to fix them.

4 MS. BROOK: Okay, very good. Thank you.

5 MR. NESBITT: You know, we've heard, oh, we have
6 to have -- you often hear we have to, you know, do
7 modeling and tune it to utility bills, which actually
8 requires utility bills.

9 But the experience, like in NYSERDA, is most
10 contractors never bother tuning the model. So, on the
11 program side they figured out, you know, how to kind of
12 estimate it.

13 And I've done, you know, my seven Banpf audits
14 last year we had to use TREAT, we had to tune the model.
15 So, you know, I'm working with my dysfunctional team and
16 I get a model back, well, it's tuned. Well, yes, the
17 utility bill answer in the model, total answer is right.
18 But where those pies are split are totally off.

19 So, we can tune the model to the wrong answer.

20 MS. BROOK: Sure.

21 MR. NESBITT: You got to then actually tune it
22 right to the -- you know, so everything actually is
23 falling right in all the right places. And then it's,
24 hopefully, the computer is actually making all the right
25 calculations, that it actually happens.

1 MS. BROOK: Right.

2 MR. NESBITT: But this is also a lot more work.

3 MS. BROOK: George, you've been blinged.

4 MR. NESBITT: I've been blinged, I did hear it,
5 yes.

6 MS. BROOK: Officially blinged. And Alecia's
7 going to follow up, though, just to close out.

8 MR. NESBITT: Yeah.

9 MS. BROOK: Thanks.

10 MS. WARD: So, two things. One is in the
11 marketplace, you know, it would be great if we could
12 just sub-meter everything because then we'd have a lot
13 of information and we could make really good choices
14 about it. And in the one percent of the market that has
15 sub-metering, that's a wonderful tool.

16 In the other portion of the market where we
17 have, you know, Smart Meters, where it's not sub-
18 metering, but it gives us a lot more 15-minute interval
19 data that we can make choices about, that's great, too.

20 In the 70 percent of the rest of the market
21 where we don't have those two things available to us, we
22 are required to use the limited technology of
23 simulations in order to depict reality.

24 And then what is important about that is to be
25 able to have a feedback loop that consistently helps us

1 actualize our predicted reality in the simulation with
2 the actual reality that's happening.

3 And I'd say all of these tools that we've each
4 described, sub-metering and real-time feedback loops,
5 and simulation-based benchmarking and all sorts of
6 things help to make better choices.

7 But each of them, individually, is like a
8 Polaroid snapshot of a building. And what we want to do
9 is piece all those Polaroid's together so we have a bit
10 of a video, a moving target for how that building is
11 performing and then how each of the different tools we
12 have in our toolbox, whether it's DSM programs, or
13 whether it's benchmarking at a policy level, or whether
14 it's something else can be deployed and pursued of
15 capturing the most efficiency that we can, with the
16 greatest savings in that process.

17 So, you know, I get the indictment, but all of
18 these are imperfect tools.

19 MR. NESBITT: No indictment was served.

20 MS. WARD: And we just sort of need to find our
21 best path of imperfection towards a good solution that
22 hurts as few people in the marketplace as can, captures
23 as much savings as possible, and then moves us all sort
24 of forward on the path.

25 MS. BROOK: Great, thank you.

1 MR. NESBITT: I mean we hear lots of cries about
2 how bad the modeling is but, yeah, I mean my dad 30
3 years ago, Carl Nesbitt, my dad, and I've found -- you
4 know, we haven't gone back and tuned our models based on
5 actual data and we have to do it, it's important.

6 MS. WARD: And a good deal of research and
7 sensitivity analysis will help to inform those things.
8 As we say, okay, if you take parametric models and you
9 plug them into DOE II versus Energy Plus, versus Apache,
10 versus whatever that what we learn in the process of
11 figuring out how the engines, themselves, treat the
12 inputs is a really valuable piece of how we can control
13 for variables when it comes to the policy, and the
14 rating, and the labeling, and the disclosure on the back
15 ends.

16 MS. BROOK: Uh-hum, right.

17 MR. NESBITT: Even with the same engine in
18 Micropas and EnergyPro we still have some differences,
19 and I can talk about that.

20 MS. WARD: We're going to keep working on it.

21 MS. BROOK: All right, thanks. I think that's
22 it for this panel.

23 COMMISSIONER MC ALLISTER: Okay, actually, can
24 I -- I want to -- this sort of got me thinking about
25 something else that -- I think it's quick, but I want to

1 make sure that it's at least beginning on the record.

2 So, you know, there's been a lot of talk about
3 how we have to get -- you know, we have to have a broad
4 blanket, try to get all the market sectors that we
5 possibly can if we have any hope of meeting the State's
6 goals for energy carbon, what have you.

7 So, I'm thinking about the hard to reach part of
8 the commercial sector and, you know, there are lots of
9 different definitions of that but, basically, sort of
10 small commercial. You know, you mentioned the retail
11 that is, you know, hard to slice and dice properly, and
12 you could say that about a lot of different sectors.
13 You know, you got fast food, you've got a lot of
14 different unique types of businesses.

15 So, how might -- this is a big question and
16 we're not going to answer it here, but how might we make
17 sure that the contractor community or the services
18 community that is going into those facilities has the
19 appropriate expertise to get to the level that we want?

20 We just talked about all these, you know,
21 different models, and it's fairly technical, quite
22 technical and it requires specialization in the
23 workforce, okay.

24 So, what contractor is going to sort of ally
25 themselves with, you know, Carl's, Jr., Jack in the Box

1 or, you know, whatever particular retail chain to say,
2 okay, I'm going to do all their buildings and here's
3 what this looks like, and it's going to be cost
4 effective?

5 I guess, you know, we need to -- to some extent
6 that ecosystem sort of exists, but we've got to move it
7 sort of to the small commercial and down market.

8 And what can we do in this proceeding to sort of
9 help establish a foundation for that workforce
10 development? We'll talk about that, probably, in the
11 next panel, but sort of make this most accessible to the
12 most number of businesses.

13 I see Martha nodding. I'm probably not
14 articulating this question exactly.

15 MS. BROOK: I'm not nodding because I have the
16 answer.

17 COMMISSIONER MC ALLISTER: Yeah. Darn, you
18 know, I was hoping you could just tell me the answer to
19 that.

20 And I think the workforce aspect is probably for
21 the next panel. But as far as making these tools
22 effective and efficient to implement, sort of accessible
23 to the kind of contractors that are necessarily going to
24 have to go get these buildings, you know, we're not
25 talking about multi-nationally ESCos, probably, we're

1 talking about, you know, relatively local, relatively
2 small businesses.

3 So, I guess what's the sweet spot there?

4 MS. BROOK: Karl?

5 MR. BROWN: Well, I mentioned feedback and
6 broken feedback loops. What we find is that it's a
7 matter of communication gaps and lack of ability for the
8 different actors in the building, the delivery process
9 in the building service process to effectively
10 communicate.

11 So, if this market is not being fully reached,
12 it's a communication issue between the service providers
13 and their clients.

14 And I think there is a potential role for
15 creating a language standards to create a better basis
16 for communication.

17 MS. BROOK: Okay, good. Denny.

18 MR. MANN: I would just say, traditionally,
19 contractors are very poor at marketing.

20 MS. BROOK: Uh-hum.

21 MR. MANN: And so as I've gone through like this
22 QM program, we've gone back to PG&E and Southern
23 California Edison, you know, whatever you can do to help
24 get that word out so it's not, quote/unquote, the
25 contractor trying to educate the customer when they've

1 never heard of it before.

2 You know, the more we can get Energy Star out
3 there, the more that we can get information -- you know,
4 a lot of times in these smaller buildings there's a
5 mindset that the energy cost is the energy cost, there's
6 not an awful lot I can do about it.

7 And you can sit down and say but, you know, 35
8 percent of your energy cost is going to the air
9 conditioning and we're the guys that do the air
10 conditioning, let us help you do that.

11 MS. BROOK: Uh-hum.

12 MR. MANN: But up until now they're really only
13 hearing it from us. You know, they haven't really felt
14 the pain of time-of-day billing, or peak day pricing,
15 those types of things.

16 But I think the more we can get the message out
17 there that then the contractors are following up, you
18 know, they just need to hear it from more than just one.

19 MS. BROOK: Right.

20 MR. MANN: So, that's the whole education,
21 increase the awareness. That's why I started by saying
22 I think going to these buildings and getting the ratings
23 on the buildings is critical because, again, it opens it
24 up.

25 We talk to building owners in San Francisco, you

1 know, when 1103 was coming and say, we'll come out and
2 do a benchmarking for you. Oh, no, you know, I don't
3 really -- the next thing you know San Francisco passes
4 it and they're calling us and saying can you do the
5 benchmarking. We've been trying to tell you that.

6 MS. BROOK: Yeah.

7 MR. MANN: So, it's that education piece.

8 MS. BROOK: Right, and I think that a rating
9 program could, if nothing else, serve that role very,
10 very effectively of just being that educational and
11 outreach piece.

12 Alecia?

13 MS. WARD: So, I think it's an excellent
14 question and I think that the way tools like this can
15 empower is it would be quite a jobs program if everybody
16 was going out and doing an audit on every single
17 building in the entire service territory and in the
18 State of California. I don't think that's feasible.

19 I think the things that these tools can do is to
20 funnel down.

21 For example, in the Minnesota benchmarking tool
22 we have 8,000 buildings in this tool. We know that
23 1,400 are located in X's service territory. Of those,
24 we know that 400 exceed their benchmark by more than a
25 certain percentage.

1 So, the next time they have to hit a performance
2 goal they can go out to that population of buildings and
3 do all the audits.

4 What that means is that if you've got a
5 dashboard and a simulation that's doing a benchmarking,
6 you've got a lot more information to share with the
7 person on the ground who's going to go out and be the
8 feet on the ground walking into that building.

9 And if you use the low-signature disaggregation
10 models that are out there to sort of say and here are
11 the top five things your guy probably needs to look for
12 when he walks through the door, that should make the
13 most effective use of a ratepayer dollar if you can
14 combine Smart technology with good feet on the ground,
15 in the targeted market that you're trying reach.

16 And all of that depends on properly segmenting
17 those markets out and getting good comparison buildings,
18 and then empowering people to have, you know, capacity
19 building and the right level of education as they walk
20 into that building.

21 MR. MANN: Another thing that we've done is Da
22 Vita Dialysis Clinics. We went out and we did
23 benchmarking on 40 of their facilities. And so that
24 they had a budget of X number of dollars, they could do
25 capital items with upgrades and stuff like that.

1 Well, here's your 40 buildings, here's the ones
2 with the lowest scores, here's the ones with the highest
3 scores, let's take those dollars that you have available
4 in next year's budget and funnel those to the buildings
5 that you're going to get the biggest bang for your buck
6 for.

7 COMMISSIONER MC ALLISTER: That was a dialysis
8 clinic, you said?

9 MR. MANN: Yeah.

10 COMMISSIONER MC ALLISTER: Okay, so that's like
11 a perfect small business. That's a great case study, we
12 should look at that.

13 MS. BROOK: Yeah.

14 MR. MANN: Actually, and they're very proactive,
15 they have this whole Village Green that they run and
16 they're very conscientious as far as the community and
17 the environment.

18 MS. BROOK: Yeah, fantastic.

19 MR. ASHUCKIAN: We have one more comment here
20 from the audience.

21 MR. HARGROVE: Hello, my name is Matthew
22 Hargrove; I'm with the California Business Properties
23 Association. We represent the International Council of
24 Shopping Centers, as well as building owners and
25 managers, and several other commercial groups in the

1 State of California.

2 We've been working really hard with the Energy
3 Commission on 1103 implementation. And I wanted to
4 address the issue with retail.

5 We found 1103 was difficult for many reasons not
6 mentioned here today. It's not because those -- most of
7 the retail groups don't want to become more energy
8 efficient, but there's some very real issues in that
9 sector that need to be addressed.

10 I mean we could point to Wal-Mart, who's really
11 one of the most energy efficient companies in the
12 nation, who's sharing all their information.

13 But, really, with a lot of the buildings that we
14 have, and we had to benchmark under 1103, the issue
15 really comes down to we have tenants in those buildings
16 and many of those tenants have master meters.

17 And even though we own the building, or we own
18 the ground, it's very difficult for us to come in and
19 force information out of our tenants, or force
20 retailers, who want to make sure they have a certain
21 type of lighting in order to sell their product in a way
22 that we can influence that.

23 So, I think we absolutely agree with this whole
24 proceeding today. I mean we know that the tough nut to
25 crack here is existing buildings. That's where a huge

1 amount of the energy savings are going to come from.

2 We've been saying all along, under AB 32 that's
3 where we're going to get the greenhouse gas savings.

4 But it's very difficult, as Fran said earlier,
5 to come at this with a one-size-fits-all approach.

6 And I think sometimes in the past when we've
7 done that, it's actually taken us longer to get around
8 to the solution because we've been trying to apply
9 something that works in class A office to an industrial
10 building, or to a multi-tenanted retail facility.

11 So, we look forward to bringing in more
12 practitioners who are doing this. We have a lot of
13 folks who are not actually here in the room today
14 because they're out at their properties doing energy
15 efficiency.

16 We have folks who work for companies who do this
17 on a daily basis because it's a bottom line issue for
18 them. They're very innovative and they're out in front
19 on this stuff.

20 So, we look forward to continuing to work with
21 the Energy Commission.

22 We supported 758 in the Legislature and we have
23 a stake in making sure that this thing works, so we
24 really appreciate this, the time that everyone's taken
25 today.

1 But I wanted to make sure I addressed the retail
2 issue because that's been a particularly tough thing, as
3 Martha can tell you.

4 In fact, all of our buildings, class A office,
5 any time you have a building with a tenant in it, you
6 have some difficulty implementing some of this stuff.

7 So, thank you very much.

8 MS. BROOK: Thank you, Matthew.

9 Okay, I think we're going to take a break.

10 MR. ASHUCKIAN: Okay. I just want to make,
11 again, one more announcement that all the presentations
12 and the handouts that have been throughout these last
13 two days will be on our website by Friday.

14 And with that, let's take a ten-minute break and
15 be ready to go at three o'clock.

16 MS. BROOK: Thank you.

17 (Off the record at 2:50 p.m.)

18 (Reconvene at 3:02 p.m.)

19 MR. REGNIER: First off, I want to thank
20 everybody for their patience. This has been an action-
21 packed couple of days. I'm glad everybody could stick
22 it out to the very end.

23 Like Dave said, this is the nonresidential
24 building upgrade program's panel.

25 I'd like to first introduce our panelists. Our

1 first panelist is Carol Zabin. She's got a PhD from the
2 University of California, Berkeley, and is the Chair for
3 the Green Jobs Council, California Workforce Investment
4 Board.

5 Carol is a labor economist who's research has
6 addressed job quality, workforce development, low-wage
7 labor markets, and other economic development issues.

8 Carol was lead author for the comprehensive
9 California Workforce Training and Education Needs
10 Assessment for Energy Efficiency, a study commissioned
11 by the California Public Utilities Commission.

12 Carol also serves as Co-Chair on the Donald Vial
13 Center on Employment and the Green Economy.

14 She is on the Executive Committee of the
15 California Workforce Board and Chairs it's Green Collar
16 Jobs Council.

17 She regularly provides technical assistance to
18 labor unions, low-income advocacy groups, training
19 institutions, and government agencies.

20 Before joining the Labor Center she was on the
21 faculty of Tulane University and UCLA.

22 MS. ZABIN: Thank you and thank you for inviting
23 me to speak on this panel.

24 Is this working good?

25 MR. REGNIER: Yeah, yeah.

1 MS. ZABIN: Okay. So, I think I am supposed to
2 address question 30 and a little bit of 31. And,
3 really, my expertise is on the workforce side and not so
4 much on the driving demand side, although the two
5 certainly are related.

6 I was really pleased with the scoping plan and
7 I'm saying that to Commissioner McAllister because last
8 time I spoke at a hearing I was a bit more critical.
9 So, I'm happy to say that I -- although I could quibble
10 with pieces of it, in terms of the identification of the
11 key market needs I thought was right on.

12 And I want to address each of the market needs
13 identified really briefly, in a minute. Let me just
14 list them first, and the needs that the scoping report
15 identified are the need for stackable credentials, which
16 is just lingo for making sure that people have training
17 paths where you get credit for your previous training
18 and can build on it.

19 The alignment of training programs, so they fit
20 together, the importance of defining quality standards,
21 the role of the CEC in promoting the value of skills,
22 standards and certifications.

23 And then, finally, filling skills gaps of,
24 really, the incumbent or the current workforce.

25 Before I go into a little bit on each of these,

1 I just have a couple overarching recommendations that
2 actually affect each of these areas.

3 And the first is that I think we're moving
4 towards this and there was mention in the scoping plan,
5 but I think there's a tremendous opportunity in the
6 Brown Administration and going forward to really pull in
7 the Labor and Workforce Development Agency. And,
8 really, that we should have all the planning and
9 investment in the workforce area by the CEC, and the
10 CPUC's, and the IOU's really should be done in concert
11 with the Labor Agency, and through some sort of
12 interagency advisory committee that includes the
13 Workforce Board, the Division of Apprenticeship
14 Standards, the Department of Industrial Relations, the
15 Employment Training Panel, as well as our education
16 institutions.

17 So, that's point number one and I think all
18 these specific issues can be moved forward by that
19 interagency collaboration.

20 And I do hope that the Green Collar Jobs
21 Council, which is a committee of the State Workforce
22 Investment Board, and that I'll be chairing, can play a
23 role in that.

24 The second point I want to make is I think for
25 the commercial sector the key, really heretofore

1 untapped strategic opportunity for the State in terms
2 of workforce education and training is the State
3 Certified Apprenticeship System.

4 Our study that was mentioned a minute ago,
5 looking at workforce needs in this sector really showed
6 that about two-thirds of the workforce is in the
7 construction trade. Another six is sort of in the
8 professional designers, specifiers, architects and
9 engineers.

10 But that importance of the trades really means
11 that that's a key area for focus. And other forums have
12 sort of gone through the litany of why apprenticeship,
13 as a structure, is so valuable.

14 But just to super repeat it really quickly, you
15 know, it is about a hundred million of private money.
16 You know, most programs are five years, so it really is
17 the college for construction industry trade's work.
18 It's demand driven. Employers drive the curriculum so
19 it's valuable to them.

20 It's, of course, an earn-while-you-learn model,
21 so it's better than college in the sense that you exit
22 without a huge debt, which is now occurring.

23 So, I think however the CEC can have an
24 influence, either through funding from EPIC, through
25 your bully pulpit role or participation in any

1 interagency agreements, through your involvement in the
2 CPUC proceedings, through your support for Federal grant
3 opportunities looking at apprenticeship and including
4 apprenticeship is really going to be key.

5 So, just to very briefly go through the specific
6 areas, alignment and stackable credentials are really an
7 important thing to do. The CEC doesn't, I don't
8 believe, have that much leverage or ability to help
9 that.

10 There's great things happening in the State,
11 trying to get community colleges and apprenticeship
12 working together. AB 554 that passed last year actually
13 forces the WIB to work and align better with
14 apprenticeship.

15 I think the key area, however, that the CEC can
16 play a role in, which I have also said in other forums,
17 is in developing and adopting standards.

18 And you already have some experience in this
19 with standards certifications for raters, in acceptance
20 testing. You can work with -- you can really build off
21 the work of the DOE, which is also involved in creating
22 skill set certifications.

23 And you can help promote standards, not just
24 through participating in the CPUC proceedings, where
25 this will all be debated once again, but also in the

1 non-ratepayer pots of money. We're going to be
2 seeing -- you know, we may be seeing \$500 million per
3 for five years, if Prop. 39 passes. There are revenues
4 from the cap and trade auction that will -- some of
5 which will go into energy efficiency.

6 And in a little bit more agile and perhaps more
7 flexible forums, pushing standards, if only to
8 experiment with their value and test and evaluate their
9 value will be possible.

10 I'm going to stop there.

11 MR. REGNIER: Thank you.

12 Our next panelist, Bill McNamara, has more than
13 25 years' of experience as an executive and senior
14 manager in all aspects of business operations, planning
15 and business development, and product development for
16 technology companies.

17 For the last ten years Bill has worked within
18 the energy efficiency industry designing and
19 implementing commercial retail grocery, and large
20 commercial commissioning programs, developing and
21 patenting energy management systems technology for
22 industrial sector, compressed air and refrigeration
23 systems, and developing systems for ocean wave
24 electrical generation systems.

25 As Director for Energy Efficiency Programs in

1 California for PECI, Bill worked closely with the
2 California Conservation Corps to architect, design, and
3 successfully implement the CEC's ARRA-funded Energy
4 Smart Jobs Program to substantially save energy and
5 reduce costs for traditionally hard to reach commercial
6 retail facilities located throughout the State, and
7 create energy industry jobs and viable work experience
8 for CCC Corps members located throughout the State.

9 Working with the CCC, Bill is now designing the
10 next generation Energy and Workforce Development Program
11 which is focused on commercial retail, large commercial,
12 and residential buildings.

13 MR. MC NAMARA: Thank you. First, I wanted to
14 say thank you for this workshop on AB 758, and also for
15 our participation. In my opinion, this is one of the
16 best that I've seen.

17 COMMISSIONER MC ALLISTER: If you can get closer
18 to the mic, I think it will help.

19 MR. MC NAMARA: As I said, in my opinion this is
20 one of the best that I've had a chance to attend.

21 The questions that I'm addressing today have to
22 do with -- in question number 29, question number 30,
23 and it has to do with the fact that there are many types
24 of diversity, much of which have already been identified
25 over the last two days here, in the commercial building

1 sector.

2 So, what kinds of strategies and approaches
3 might be used to effectively gain more energy efficiency
4 across those -- across those areas of diversity amongst
5 commercial, or shall I say, nonresidential buildings?

6 So, in the first case there is a very strong
7 need for contextualization for the building owners and
8 ratepayers for whatever the program opportunities might
9 be that are opportunistically presented to them.

10 That has to do, in many cases, with the ability
11 to communicate to them from a marketing perspective, as
12 well as to apply to them an understanding of what the
13 benefits they might actually expect to get from these
14 programs look like.

15 In addition to that, they also have a need to
16 know what other programs might be available.

17 So, the actual outreach to these individuals,
18 although they are in different parts or different
19 sectors of the nonresidential building part of the
20 energy efficiency perspective, they actually have a
21 commonality in terms of their need to understand what
22 the programs are that are available, how they can make
23 use of them and, in many cases, one of the greatest
24 obstacles, which has been addressed before, is the fact
25 that they may not in fact have the finances capable of

1 addressing what we would like them to do, which is a
2 whole building perspective.

3 So, the whole building perspective, itself, is
4 an interesting aspect that does need to be
5 contextualized further for building owners in the sense
6 that even if we were able -- and even if they were able
7 to financially afford and willing to implement all the
8 measures that might be recommended for their building,
9 in fact it's an iterative process. It's a continuum of
10 change.

11 So, setting the expectation for those building
12 owners of the fact that they're going to be iteratively
13 addressed over time, for reasons that are both economic,
14 they might be program availability, incentivization and
15 other factors is simply a fact.

16 And in many cases, as was addressed earlier
17 today in Martha's presentation, the vast majority of the
18 commercial buildings are small- to medium-sized
19 buildings. And so addressing these particular buildings
20 requires a combination of being able to outreach to them
21 effectively, as well as to communicate all of the
22 opportunities and benefits that are possible.

23 This is a -- you know, it sounds like a fairly
24 straight forward thing to do, perhaps, from an
25 information packaging stand point, but getting people to

1 listen to this and respond in ways that you want them to
2 is a whole different art.

3 So, commonalities in terms of actual
4 opportunities across these buildings are fairly straight
5 forward. For example, virtually all the buildings have
6 HVAC of some type.

7 All of them, as has been illustrated earlier,
8 those HVAC systems are running very ineffectively in
9 many cases, or it's certainly very inefficiently.

10 There's a need for commissioning in buildings,
11 there's a need for a number of particular strategies,
12 energy strategies that lead to the whole building
13 approach, including things like control systems.

14 So, from those perspectives, which leads me to
15 question number 30, in my experience and the things that
16 I've been doing for the last several years, the ARRA,
17 recent ARRA program, the Energy Smart Jobs Program is a
18 very good case study for a very large-scale pilot that
19 was implemented across the commercial retail sector,
20 specifically targeting small businesses.

21 And the small businesses were distributed
22 throughout the State, which has the further complication
23 of being located in multiple utility districts, that had
24 multiple utility programs, some having finance offers,
25 some not.

1 Those particular programs, what we did was we
2 constructed a business model wherein we would go and we
3 actually hired, as a subcontractor, the California
4 Conservation Corps.

5 We sent Corps members out under -- trained them,
6 a combination of university, community colleges,
7 manufacturers, other business partners, energy
8 efficiency companies, and we put together an approach to
9 these buildings wherein the intention was to
10 contextualize and bring the building owners into an
11 understanding of what it is that might be possible
12 within their building.

13 At the same time we automated, using a hand-held
14 iPhone-based device, using software that we developed at
15 PECEI, specifically to do energy surveys that were done
16 locally at the individual facilities.

17 The surveys, themselves, were actually
18 instructional in two ways. They would teach the
19 surveyor how to do the surveys. Now, they'd already
20 been trained, but the reality was it was push/pull
21 application so that technology could change, so that
22 when they moved from utility district to another the
23 messaging could change with it.

24 In addition to that the information, once it was
25 gleaned from there, could be uploaded to individuals who

1 were professionals, and all from an energy efficiency
2 stand point, for evaluation purposes.

3 They were also trained to observe other energy
4 efficiency opportunities in those facilities that were
5 beyond the six measures, which were targeted at
6 commercial refrigeration, commercial refrigeration
7 lighting, and control systems for compressors and
8 economizers, those sorts of things.

9 The results of that were that over 6,000 stores,
10 retail stores disbursed across the State, were actually
11 surveyed. And from that 6,200, actually, from that
12 number more than 5,000 of them converted to do all of
13 the measures that were recommended.

14 So, it's a very, very high conversion rate, most
15 of which was due to the fact, A, that they understood
16 really what the things were that we wanted to do; B,
17 that they actually did produce the results.

18 And also, we used the peer groups, such as
19 associations, like the Korean Grocers Association, and
20 things like that to establish case studies, communicate
21 those case studies out to individual groups, and get the
22 information out in a much more effective manner than
23 just they received something in their utility bill, or
24 perhaps there's a public announcement on radio or other
25 forums.

1 So, one of the key elements from a workforce
2 development stand point is the fact that in many cases
3 the work that's done by the professionals in the energy
4 efficiency industry are not actually things that they
5 perhaps should be doing. Meaning that you may have a
6 very over-qualified individual doing important work
7 that's appropriate for that, but some of that work may
8 in fact be suitable and, therefore, represent workforce
9 development opportunity for someone new coming into the
10 marketplace.

11 So, we actually stratified the workforce and
12 then identified those tasks to competency levels and
13 training levels, and distributed those works so that we
14 could bring more people into the workforce and also
15 allow a much more cost-effective model to be applied
16 and, therefore, make the energy efficiency dollars go
17 further.

18 MR. REGNIER: Thank you, Bill.

19 Our third panelist is Jenna Olsen. Jenna Olsen
20 is the Director of Core Products, Customer Energy
21 Solutions at PG&E, where she directs a portfolio of
22 offerings that help customers manage their energy usage.

23 Her team manages emerging technologies, rebates,
24 incentives and program offerings for residential, small
25 and medium, and large commercial and industry customers.

1 She also manages the technology platforms that
2 help customers understand their energy use and build
3 plans to reduce their use.

4 Prior to this role Jenna served as Chief of
5 State to the Vice-President for Customer Energy
6 Solutions, and also managed third-party and government
7 partnership sales channels and energy efficiency at
8 PG&E.

9 Before coming to PG&E, Jenna worked with a
10 sustainability consulting firm advising multi-national
11 corporations on integrating sustainability into their
12 businesses.

13 She also served as Executive Director of the
14 Tuolumne River Trust, a San Francisco nonprofit where
15 she now volunteers.

16 She has a joint master's in public policy and
17 natural resources from the University of Michigan, and
18 also graduated with high distinction from the University
19 of Virginia.

20 MS. OLSEN: All right, thank you. Thanks for
21 having me here to comment on the AB 758 scoping.

22 I'm going to address questions 28 and 32, but
23 want to give a couple of overarching comments about
24 whole building, first.

25 And first want to talk about -- it sounds like

1 whole building kind of means different things to
2 different people. In some cases maybe it just means
3 doing multiple measures targeting different end uses.
4 Other cases maybe it means deep retrofits, getting more
5 than maybe 50 percent energy savings, or maybe it's
6 equivalent to the residential whole house building
7 program where there's some kind of a loading order and a
8 focus on the building shell.

9 So, wanted to let you know PG&E has proposed in
10 our '13-'14 filing with the CPUC to do a whole building
11 demonstration project. And we've been building our
12 thoughts around this. We still have lots of
13 conversations to have with the energy division around
14 this, so thoughts here are going to be high level and
15 preliminary.

16 But wanted to share with you where we're heading
17 on these thoughts and most of that has been informed by
18 a workshop that was held in May by the California
19 Commissioning Collaborative that dove into a lot of
20 these issues.

21 So, what are some of the features of whole
22 building? And it starts, probably, with performance-
23 based. It should be based on some kind of measure of
24 the actual performance of the building.

25 Also, this should capture the equipment, as well

1 as the operational, as well as the behavioral savings
2 that can be achieved in that building.

3 Thirdly, it would use interval data to establish
4 the baseline as well as to measure the savings that have
5 been achieved.

6 So that, then, necessarily takes us to the
7 fourth which is that's the M&V protocol that's used?
8 And there are some protocols, IPMVP Option C, which fits
9 pretty well but may need some modifications, which we
10 can talk about during Q&A, potentially.

11 So, what is the actual program? So, it starts
12 with a base lining of the energy usage. PG&E's
13 territory, we're mostly fully deployed with Smart
14 Meters, so we have 12 months' of data for pretty much
15 every building we have in our territory, so you can do
16 the baseline. Need to make some adjustments to it,
17 obviously.

18 And then you apply the treatment, or the
19 intervention, or the program, whatever terminology you
20 want to use.

21 And so we're thinking about a wide range here of
22 things that could be done, starting from maybe more
23 traditional to potentially being more expansive,
24 starting out with multiple retrofit measures, then
25 looking at advanced controls. Obviously, retro-

1 commissioning fits very well in here.

2 Then you can layer on some of the energy
3 information services that were talked about in the
4 previous panel, where you have energy dashboards,
5 continuous loops of feedback from the interval meter
6 data.

7 That can then enhance and streamline the audit
8 and retro-commissioning screening processes.

9 You may then want to even go towards enabling
10 continuous treatment where, instead of just having a
11 single intervention, a single program at a single day,
12 where that's happening over time.

13 So, whether that's providing just this feedback,
14 could that, itself, be the intervention in the program?
15 Do you need to have some kind of coach, particularly,
16 maybe for the smaller companies, the smaller businesses
17 that don't have facility engineers on staff?

18 Or is it repeated tuning and maintaining
19 commissioning?

20 Again, you'd have the M&V based on the building
21 performance using the meter data, and then an incentive
22 that could be paid one time. If you're getting into
23 continuous, maybe it's an incentive paid over time.

24 So, there's obviously some challenges that would
25 need to be worked through. What are the base lining

1 capabilities of some of these software tools? Again, I
2 mentioned the EM&V protocols.

3 And then the idea of doing continual base
4 lining, if you're going to have continual treatment, so
5 that you don't have to stop working with the customer to
6 help them improve their facility so that you can
7 establish the baseline, so that you can do the
8 measurement you'd want to be able to have some kind of
9 continual base lining there.

10 One issue that I think is probably particularly
11 relevant for AB 758 and the CEC that this whole concept
12 brings into -- brings into the fore is the idea of the
13 code as the baseline.

14 So, we all know that oftentimes there are
15 situations where there's equipment that is still
16 operational, maybe it's kind of a repair-indefinite
17 situation, and it's far below code. And the utility's
18 allowed to offer an incentive based on that increment
19 above code.

20 And so, really being able to motivate the
21 customer to make that change can be difficult in that
22 situation.

23 And if we're looking at measuring the savings
24 based on meter data, which helps us streamline the
25 process, if you have to then go in and measure where are

1 things related to code, that starts to get away from
2 some of the efficiencies of this whole building
3 approach.

4 So, we think there's an opportunity and the CPUC
5 has kind of opened the door to this with dual baseline
6 policy, that maybe we could get together with the CEC,
7 the CPUC and look at is there some way to be able to
8 offer the incentive to the customer to make that full
9 change from way below code to to-code, or a little bit
10 above code, and then do some kind of accounting on the
11 back end so that there's not double counting. You would
12 attribute those savings of getting to the code to the
13 Codes and Standards Program that increment above to the
14 voluntary program. That would be largely not visible to
15 the customer because they don't really care about that,
16 anyway.

17 So, all right, so getting quickly to answers to
18 the questions, "How can whole building upgrade programs
19 be encouraged in the commercial sector?"

20 I think exploration of these approaches that
21 we're considering would help to bring the approach down
22 market, as well as work with larger customers and,
23 again, addressing the issue with code in a mutually
24 agreeable fashion between the CPUC and the CEC.

25 "Should specific equipment, advanced upgrades be

1 considered whole building?"

2 So, again, I think ideally the whole building
3 program would not be focused on equipment but, rather,
4 on the building performance.

5 If you wanted it to be focused on equipment, you
6 could probably still make that work. In that case
7 advanced controls probably would work since, usually,
8 they're going to be controlling multiple pieces of
9 equipment in the building.

10 And, "What criteria should be considered for a
11 program to be whole building?"

12 So, again, it should be performance-based on
13 maybe energy use intensity or a benchmark. It wouldn't
14 distinguish between equipment operational and behavioral
15 savings, it would use the interval data. May want to
16 define some kind of comprehensive nature of the program
17 and may eventually evolve that program into a continuous
18 treatment rather than a single intervention with the
19 customer.

20 And the last question 32, all continuous
21 commissioning. As you can tell, the way we're thinking
22 about whole building really just starts to merge
23 continuous commissioning into that overall concept. So,
24 yes, continuous commissioning can play a critical role
25 and we have some ideas about how that can work in the

1 SNB sector as well. Thank you.

2 MR. REGNIER: Thank you, Jenna.

3 So last, but definitely not least, we have
4 Derrick Rebello. Derrick Rebello is the President of
5 QuEST. Mr. Rebello has over 15 years' of experience in
6 the implementation and evaluation of energy efficiency
7 programs.

8 At QuEST Mr. Rebello managed a program portfolio
9 of more than \$40 million in energy efficiency programs
10 across small commercial, large commercial, and
11 industrial spanning sectors -- excuse me -- and
12 industrial, spanning sector as diverse as high tech,
13 wastewater treatment and healthcare.

14 In addition, QuEST manages a very successful
15 local government partnership, the East Bay Energy Watch.

16 Mr. Rebello has a PhD in economics from the
17 University of Washington.

18 MR. REBELLO: Thank you for giving me a chance
19 to speak here today.

20 I think questions 29, 31, and 32 are mapped to
21 me, 29 and 31 will probably start to blend together.

22 When I think about question 29 I think about it
23 more from a sort of comprehensive stand point. So, if
24 we're working with small, medium businesses, even large,
25 how can we sort of capture as much energy savings once

1 we walk into the building, you know, looking at 20
2 percent or something in that neighborhood.

3 And a lot of this is, I think, driven by some of
4 our local government partnerships. Talking with cities
5 who have climate action plans, who are trying to hit
6 these goals, they're struggling to figure out where is
7 that savings going to come from because no matter what
8 they do to their buildings, it's still really a drop in
9 the bucket.

10 So, thinking about it within that context of
11 trying to go deeper, I think the answer really is split
12 between two -- splitting commercial between small and
13 medium, and then large, because I think are different.

14 Thinking about small and medium business, these
15 business owners, they are the purchasing agent, they're
16 the accountant, they're the sales manager, they are the
17 facilities manager and they're also the energy manager.

18 They don't have time to go a website, pull down
19 an application, figure out what they should do. And so
20 in that case your best bet, if we're going to make some
21 strides, is through a direct install model where
22 somebody is walking through the door, they're doing an
23 audit, making some changes in real time, and then
24 following on with that customer and continuing to coach
25 them.

1 And this is really a sort of a door-to-door type
2 of a campaign.

3 We've seen pretty good success with that model
4 because, really, I think the hassle costs and the
5 information costs are probably the bigger barriers
6 relative to, say, finance for example.

7 Thinking about the larger customers, you know,
8 I've been working with them for over 15 years and I've
9 brought amazing projects to them financially and they
10 said, ah, you know, let me think about it. I mean stuff
11 that would pay back in three months, some stuff that was
12 actually free.

13 And these are large hospital chains, I mean
14 people who have been on the record of saying we support
15 sustainability, et cetera, et cetera.

16 So, you know, they need some specific solutions.
17 They need expertise. I mean what works in a data center
18 doesn't necessarily work in healthcare.

19 You also have to have some credibility before
20 you walk in the door.

21 All that being said, even when you package up
22 these financially fantastic projects, I think the
23 organizational aspect of this is becoming, at least in
24 my mind, the bigger barrier.

25 Finance isn't really an issue with on-bill

1 finance these days, where you can get \$250,000 at zero
2 interest, so long as we can identify a number of
3 projects that should just fly, but it doesn't.

4 And so we've sort of taking a step back and are
5 walking customers through almost an organizational
6 interview to coach them along to see whether they
7 actually have the -- not the resources to do a project
8 but, really, the organizational ability. Because,
9 again, I think those barriers are much larger.

10 Moving on to question 31, again, I think the
11 issues with the small sector are information and time.
12 And so your direct install model is going to help solve
13 a number of those problems.

14 With regards to the split incentive, we haven't
15 seen that as being much of an issue, particularly in the
16 small and medium side. Most customers will pay for
17 financially attractive projects out of their own pocket.
18 So, I'm thinking in the neighborhood of, you know,
19 nothing more than \$2,000.

20 Many times their leases are such that they do
21 not have to get approval in order to move forward on
22 these items.

23 And then we also asked about community
24 organizations. QuEST ran a program with the City of
25 Oakland, called Oakland Shines, which was an ARRA-funded

1 program. And for that program we brought in a number of
2 neighborhood associations, we worked with them very
3 closely, we went to their events. I mean that was sort
4 of one of the key items there was going to where the
5 business owners are, and they're at their monthly
6 meetings, they're at their monthly breakfasts, those
7 sorts of things.

8 So, going there, partnering with them,
9 identifying the individual within that organization or
10 association who is really the key mover or shaking I
11 think is very important, and getting a project done with
12 that individual because they then become sort of a
13 figurehead for doing more within the organization.

14 And then I guess, sort of lastly, as you're
15 doing these campaigns, thinking -- we had a very
16 successful campaign in Chinatown, in Oakland, and the
17 clear message there was you've got to do that in
18 language and in culture. There's no way we would have
19 been as successful as we were if we did not have
20 Cantonese speakers as part of the program. It would
21 never have worked.

22 And the last question, continuous commissioning;
23 I think the answer is yes. With the advances in
24 software tools and the plethora of Smart Meter data that
25 we have, continuous commissioning, now the time is

1 right.

2 I think, though, that we need to sort of change
3 a bit of the rules in terms of how the savings are
4 settled. So, thinking about it within the utility
5 program context the way that retro-commissioning
6 programs operate now there are a series of engineering
7 calculations that happen. You're talking about \$10,000
8 to \$20,000 to pull it off on the low side.

9 That's obviously not going to fly for the small
10 and medium business sector.

11 So, in that case we need an alternative method
12 to settle on what the savings are so they can receive
13 some sort of an incentive, or at least the utilities can
14 claim credit for the savings.

15 And so we look to demand response in the way
16 that a baseline is developed with demand response, and
17 then after demand events happen there is a true up on
18 what the savings are.

19 We've developed a couple of approaches that
20 allow that to happen using just the Smart Meter data.
21 So, I think that has a chance to provide a low-cost
22 settlement vehicle for claiming the savings.

23 MR. REGNIER: Great, thank you.

24 I don't know if we've got any questions at this
25 point or any comments by Commissioner McAllister?

1 COMMISSIONER MC ALLISTER: I think so. We
2 actually have quite a bit of time, this is our final
3 panel and I think we've got like an hour left on it, so
4 we actually have time. Maybe if we -- I think we
5 definitely ought to sort of squeeze the excellent folks
6 here on the panel for all they can offer, but also open
7 it up. And maybe if there's any more encompassing
8 questions or issues that we need to get back to, that we
9 didn't have time to cover maybe yesterday or today, and
10 there's still people in the audience, we can potentially
11 do that.

12 Let's see, I guess I had a couple of things, so
13 just a couple of clarifications, really.

14 So, Jenna, I guess and the PUC, this is also
15 relevant for the PUC, so the above-code issue, and sort
16 of dual baseline and all that, I guess -- I'm sure
17 there's lots of discussion going on at the PUC and we
18 certainly need to be aware of that and, you know,
19 probably more engaged than we are in that; but very
20 critical that we be on the same page or at least in the
21 same discussion with the PUC.

22 I guess I'm wondering about the tradeoff
23 between -- you know, from a customer's perspective,
24 absolutely. If they're way behind code today and, you
25 know, we can only offer incentives that go above code, I

1 mean there needs -- if the option, if the alternatives
2 are do nothing or get up to code, we clearly want some
3 way to encourage people to get up to code, and so it
4 would be nice to offer incentive at least for that
5 piece, as well.

6 Anyway, I guess it seems like that, the whole
7 free-rider issue kind of rears its head there because,
8 you know, would they have done it anyway to bring it up
9 to code? Maybe there was a trigger that was just
10 basically compliance with the law.

11 So, we get back to that whole issue of, you
12 know, should we provide incentives for compliance and,
13 you know, open question.

14 But I guess what's sort of your feeling about --
15 or how's PG&E kind of approaching this issue? is there
16 a position on that as far as what the -- yeah, what the
17 tradeoffs there?

18 MS. OLSEN: I don't think we have a solid
19 position on it. We think that it's, you know, as you
20 just laid out, it's a real issue that we do see out in
21 the field is stopping some customers from taking action.
22 And that there's some room there for us to have a good
23 conversation and come up with a policy that would work
24 for customers and work for the programs, as well.

25 COMMISSIONER MC ALLISTER: Maybe what we need to

1 do is, either in this forum, or in the appropriate
2 moment over at the PUC, is to sort of make sure we're
3 communicating well with them and figuring out how we can
4 align, yeah. Hopefully, we can align.

5 You know, Simon maybe wants to -- can make a
6 comment here, too.

7 Oh, yeah, go ahead. Go ahead.

8 MS. RUDMAN: This is Monica Rudman from the
9 Energy Commission.

10 COMMISSIONER MC ALLISTER: Oh, great.

11 MS. RUDMAN: And we're dealing with this issue
12 of our evaluation of the ARRA programs. So, for our eco
13 loans and our block grant programs, which are really
14 small local governments, we're finding that the local
15 governments' equipment is so outdated and they just
16 can't update it, that it really has been an issue for us
17 that the incentive -- I don't know why I'm nervous --
18 the incentive that we paid under the ARRA programs
19 included replacement of equipment that was no longer up
20 to code.

21 And through the process of the ARRA evaluation
22 we developed the dual baseline approach and we will be
23 presenting information on the savings based on early
24 replacement, and then replacement as if there was a
25 replacement up to code. So, it is kind of an issue that

1 we're finding.

2 COMMISSIONER MC ALLISTER: Thanks, Monica,
3 appreciate that.

4 And maybe, Bill, do you have something to say
5 about this as well?

6 Maybe let's let Simon go and then --

7 MR. PENNINGTON: Yes, Bill Pennington at the
8 Energy Commission. I'm a little curious about the
9 potential solution here.

10 What I was hearing is that in terms of
11 attribution the Codes and Standards programs could gain
12 the attribution at the utility for the getting to code
13 portion, and then exceeding the code that attribution
14 could go to the program that's causing the upgrade.

15 One thing that -- I think that sounds great.
16 You know, I'm just, whoa, that's a good idea.

17 But I'm wondering what would be the funding
18 source within the Codes and Standards program to pay for
19 that increment up to code, given that that's not how
20 they're allocated funding now?

21 They're allocated funding for developing the
22 code and advocating for the code, rather than building
23 by building incentives.

24 MS. OLSEN: There's no incentive budget within
25 the Codes and Standards program right now. Right, that

1 is true, they're all things we'd need to work out.

2 MR. PENNINGTON: So you'd need to build that,
3 then.

4 COMMISSIONER MC ALLISTER: Simon.

5 MR. BAKER: Simon Baker, the PUC Energy
6 Division. So, at the risk of getting too far afield
7 from my core expertise and I can definitely bring the
8 evaluation folks, particularly Carmen Best would be an
9 appropriate person to talk to about this.

10 But so the utilities do get credit right now for
11 Codes and Standards savings to the extent that they
12 advocate for new measures that are eventually adopted
13 into code.

14 So, if any one of the measures that would, say,
15 be contemplated in PG&E's whole building design program,
16 if that were adopted into code then those savings would
17 have been quantified and some attributed savings
18 associated with that would be counted towards the
19 utility's portfolio, if not in this cycle, in future
20 cycles. And there's kind of a weird accounting that
21 happens with Codes and Standards savings.

22 But kind of at the highest level they're
23 already -- those savings already are being accounted
24 for, which is why in the evaluation process it becomes
25 really important to determine, you know, what savings

1 are occurring due to code improvements versus above-code
2 improvements.

3 The other thing I would say is that the
4 Commission, in the May Guidance Decision, recognized
5 that there are, you know, sectors that have had
6 challenges with code compliance and there may be -- a
7 case could be made by the utilities, if they wanted to
8 come forward in their budget applications to say, hey,
9 you know what, we think that this particular area, and
10 the classic example that's given is residential HVAC, is
11 a problem area, and maybe some additional incentive
12 dollars should be applied in this area, pilots
13 developed, what have you, to try and just get equipment
14 installed to code and done properly.

15 So, perhaps Jenna can speak to the extent to
16 which the utilities did propose that in their
17 applications. I know that there was some support from
18 parties, such as TURN, for doing things like that. But
19 this is definitely an issue, Commissioner, that I think
20 we should continue to follow up on in our interagency
21 dialogues.

22 COMMISSIONER MC ALLISTER: Yeah, for sure. I
23 guess the question or the problem is that if we sort of
24 relegate it -- I like the example you just gave and the
25 sort of potential solution because the problem is if we

1 pass the code and then just sort of say, okay, we're
2 done with the incentive portion except for what we sort
3 of include in the forecast with the basic that we -- you
4 know, sort of with some presumptions about what's going
5 to happen going forward, then that removes any incentive
6 to then go really get retrofits, you know, proactively.

7 Because it's sort of like it doesn't impact the
8 attribution bottom line for utilities.

9 So, if we could build a program like that where
10 it's, okay, there's an explicit goal associated with
11 going out there and ramping up, whether it's two-code
12 kind of upgrades, or whether it's with some increment
13 above code, then I think that would send the kind of
14 market -- that would send the signal to the marketplace
15 that we want to be sending.

16 So, yeah, I guess the question is how ugly does
17 it get in the implementation?

18 But, yeah, Jenna, did you want to --

19 MS. OLSEN: So, I'll just clarify, yes, Simon,
20 exactly how you described it is the way that the
21 utilities already do get credit for the work that is
22 done on the codes, to the extent that the utility is
23 involved in impacting that code.

24 So, I think what I didn't say explicitly enough
25 was that then, if we also claimed savings at the

1 individual project level that could potentially be
2 called a double counting, right, because it was already
3 counted for in the codes component of the savings.

4 So, that's where you would need some kind of
5 back end accounting to say, oh, that amount of the
6 savings was actually already counted for when we looked
7 at the savings attributed to the specific code. So,
8 that was the thought there.

9 MR. PENNINGTON: So, I have a thought about how
10 this might work. If the savings that was determined for
11 the project was based on a performance basis, comparing
12 the baseline to where the improvement went, and that was
13 the whole savings that was associated with it, you could
14 pay that much, but there's no way to pay more than that
15 at this point.

16 And then cost for accomplishing that would be a
17 mix of the low cost of the Codes and Standards program
18 and the higher cost per savings of the upgrade program.

19 It seems like the benefits you could get out of
20 that could be accomplished at a lower cost than if you
21 assumed the whole cost was driven by the upgrade
22 project. And you might see this pencil as a totality.

23 MR. BAKER: That's an intriguing idea, we'd have
24 to give that some thought.

25 I was just going to close the loop on kind of

1 the savings attribution. So, my understanding is that
2 the way that the attribution for utilities getting
3 credit for Codes and Standards savings is through a
4 modeling methodology that assumes a certain compliance
5 rate, right. So, part of the rationale for the
6 Commission welcoming proposals to provide incremental
7 incentives for measures to just come up to code in areas
8 where you have low compliance rates is that you're not
9 actually -- you're perhaps not actually seeing those
10 savings which your Codes and Standards attribution
11 methodology says that you're getting. And it's
12 basically accounting for that difference. That was the
13 rationale behind that.

14 MR. PENNINGTON: I agree.

15 COMMISSIONER MC ALLISTER: I just have one other
16 question about sort of local government capacity
17 development. It seems like we're always -- I mean we,
18 rightfully, I think, are focused on sort of the service
19 providers, contractors and kind of the marketplace as
20 sort of classically defined.

21 But, let's see, one of the panelists, let's see
22 was it Derrick, you mentioned the local government?
23 Okay, right, you were working with all the East Bay
24 folks.

25 I guess one of the -- so, one, is my

1 preconception of where local governments are right now
2 correct, which is they've been gutted, they have low
3 funding, they don't have a lot of construction activity,
4 their permit fees are down, their staffs are pretty
5 meager relative to where they were a few years ago and,
6 you know it's hard for them to really focus on much of
7 anything consistently right now, other than just sort of
8 keeping things running.

9 And yet they have -- they're on the hook for
10 regional, local carbon reductions, they have all these
11 programs to try to implement. I mean I know a bunch of
12 local jurisdictions that I've worked with, they have
13 aggressive goals. They tend to focus on their own
14 buildings. They don't really -- they kind of do
15 marketing and outreach to the citizenry and the business
16 population, but they don't really do it very well.
17 They're kind of at wits end about what to do.

18 So, how can -- so this -- I guess it's sort of
19 about the workforce and a sort of other support kind of
20 questions.

21 You know, how can the workforce, how can the
22 folks that work for the local government be better
23 prepared to do this stuff?

24 And then, also, how can they engage with the
25 contractor and service provider community to sort of do

1 things more effectively and get their local economy kind
2 of focused on this?

3 MR. REBELLO: So, most of my experience is with
4 the East Bay, so Contra Costa, Alameda County. And
5 short of Berkeley and Oakland, no one has the resources
6 to really put towards both, you know, their own
7 buildings as well as sort of -- you know, forget about
8 that, you know, trying to get out into the community and
9 affect change there.

10 And so I think that's where the role of local
11 government partnerships sort of step in where you can
12 bring technical expertise to them, allow them to
13 contribute as best they can.

14 But I can tell you, I mean budgets are as bad as
15 you've described, such that we actually have to pay
16 people to come to meetings so they can participate. And
17 they need a budget number in order to participate.

18 So, I think continuing along that mechanism
19 right now, I don't -- I'm not -- you know, I'm not
20 representing any local government people here.

21 But I don't know that there's a lot more
22 capacity for them to do much more, other than to support
23 and pitch in, provide testimony, provide quotes from the
24 mayor and sort of push that envelope. But short of, you
25 know, boots on the ground, I think really Oakland's the

1 only one that's been able to sort of step up in that
2 way.

3 MS. OLSEN: I'll also just add, and Derrick, you
4 can correct me if this seems wrong to you. And this,
5 again, from a couple of years ago when I managed the
6 Government Partnership Programs, actually, they put more
7 into the community work than into their own buildings.
8 And I think because that whole process of long lead time
9 budget cycles, and that was a bit of a barrier.

10 So, I think, and I'm sure even more difficult
11 now, and as you've commented that budgets, that local
12 governments being what they are right now.

13 MR. REBELLO: Yeah, and I guess another quick
14 example, I've approached a number of cities in the East
15 Bay and said, look, you know, through the on-bill
16 finance program you can get a million dollars of no-
17 interest loans. Let's use that to sort of plow through
18 your list of projects, you know, help make a big dent in
19 your climate action plan, at least on the municipal
20 side. And so, you know, a million dollars you can cross
21 of, you know, a pretty major barrier right there
22 instantly.

23 And the uptake has been really, really slow.
24 And so I think it goes back to, as I was saying earlier,
25 the organizational issues. Does it matter to the city

1 manager? Does it matter to the facilities? Does the
2 person above the facilities really care all that much?

3 And so right now we're working through, you
4 know, really a structured process, sort of a Six Sigma
5 type process, to get the organization primed to do the
6 project, but not investing any money in audits or things
7 like that because, otherwise, they're just going to sit
8 there.

9 COMMISSIONER MC ALLISTER: So, I guess what are
10 the factors that influence whether a local government --
11 I mean I can imagine Berkeley, you know, I know Oakland,
12 you know, they're going to be on the progressive end of
13 the spectrum.

14 But you also have, you know, Western Riverside,
15 or Chula Vista, or places like that that are -- you
16 know, they're doing things independently and proactively
17 in their own way, which doesn't look like Berkeley, it's
18 got some other model.

19 I guess I'm trying to sort of think what -- so,
20 practically speaking, you know, within this proceeding,
21 getting the right sort of people involved at the local
22 government level, whether it's that contractor community
23 in that particular place, you know, the right officials,
24 the right utility representatives, nonprofits, whatever
25 it is, looking for models that we can sort of call out

1 in this implementation.

2 MR. REBELLO: Yeah. Right, so with the East
3 Bay, I mean you've got your Berkeley's who are at one
4 end of the continuum and then, I don't know, pick some
5 other community that's on the other end.

6 What we have seen in the last -- I think we've
7 been doing this for about a decade now. We've seen in
8 the last couple of years the Climate Action Plan seems
9 to work in that cities are now more interested in the
10 Local Government Partnership, what sort of resources can
11 we bring to their community.

12 We do door-to-door campaigns where we bring
13 in -- get approval from council or from the mayor, bring
14 in PG&E, bring in the local contractors and it's a door-
15 to-door process. Now, again, this is targeting that
16 small and medium business sector.

17 So, you know, I think that that works pretty
18 well through the Local Government Partnership now, so
19 that's one model.

20 COMMISSIONER MC ALLISTER: Great, thanks. So,
21 Monica.

22 MS. RUDMAN: Monica Rudman, the Energy
23 Commission. What we've found with the ARRA programs, we
24 have some preliminary feedback, and the one-time
25 infusion of funds created this urgency and I think that

1 really motivated people to implement projects
2 immediately.

3 And in my experience with working with local
4 governments, I think you need to have a champion on
5 site. So, anything that can be done to find one person
6 that's going to take that project and get it going is
7 really more important than almost anything.

8 MR. REBELLO: I guess I have a counter to that
9 which is you need a champion, yes, but in many times
10 that champion just does not have enough to kind of get
11 those projects moving forward.

12 And we've had that with a number of cities, and
13 projects that have been sitting for two years, and these
14 projects have paybacks in less than six months. I mean
15 there's no reason for that so --

16 MS. OLSEN: Yeah, I would just echo one of the
17 ARRA implementers we met with recently talked about
18 success they had with their municipal program, and also
19 mentioned that same issue of the limited availability of
20 funds was enough to get the government to, you know,
21 move off the dime. Whereas if the funds are available
22 this year, they'll also be available next year, then
23 there's maybe not as much reason to do the project
24 because you can always do it next year.

25 MR. REBELLO: We've heard a similar thing where

1 cities have said, you know, how do we get you to move,
2 and they said, well, tell us the money's going away.

3 MR. REGNIER: That's one way.

4 So, we've got a couple members of the public
5 that wanted to speak.

6 MR. SCHMIDT: Yeah, Steve Schmidt from High
7 Energy Audits. I wanted to come back to the
8 performance-based incentives, which I think is a great
9 idea. So, I'm a PG&E customer and I know you rolled out
10 something related to natural gas use, I can't remember
11 the name. But they monitored our natural gas use from
12 one year to the next over the three winter months, and
13 we got a payment for reducing our use.

14 I know from Smart Meter data analysis we can
15 identify the base load of a house, what we call the idle
16 load, where every building is using energy whether
17 people are gone or not, and we measure in watts, and
18 there's a huge variation.

19 And on top of that, it's very easy to reduce.
20 So, we've seen lots of houses go from 900 watts down to
21 500 watts, or 300 watts down to 200 watts.

22 And I'm wondering if, first, how successful was
23 the natural gas program because it worked for us?

24 And, secondly, could you do something related to
25 a Smart Meter analysis, like idle load or something?

1 MS. OLSEN: Yeah, so I think the natural gas
2 program you're talking about is the Winter Gas Savings
3 Program, which is actually not an energy efficiency
4 program it's its own proceeding.

5 So, yeah, we have -- I don't actually work on
6 that program so I don't have the details at my
7 fingertips. But, yes, it has been successful. We have
8 some, you know, anecdotal data that for some customers,
9 knowing that program's there, they aim for it.

10 For other customers it's kind of, wow, it's a
11 surprise they did less than last year, they didn't
12 necessarily do anything specific to make that happen.

13 But, yes, we do have on our "my energy website,"
14 for both residential and small and medium business
15 customers dashboards to look at your energy usage, day,
16 month, year. Fill out some profiling information and
17 get recommendations for actions you can take to reduce
18 your usage. You can set a plan and then track your
19 progress against that plan.

20 MR. COHEN: Hi, David Cohen from the Energy
21 Coalition. So, we're currently managing the Southern
22 California Regional Energy Center, which is for L.A.
23 County and Huntington Beach, funded through grants
24 through Southern California Edison, and L.A. County's
25 using some of their Department of Energy Funds, their

1 ECBG grant.

2 And I feel like we've really hit a golden nugget
3 in the public agency sector, so we found some
4 deficiencies in the Local Government Partnership
5 Programs with the utility companies in that we found
6 that it was a very reactive program design.

7 Where we thought if we actually acted as energy
8 managers for the entire region of the Los Angeles County
9 territory, especially working with the COGs down there,
10 and we helped -- besides setting up a financing program,
11 using private equity lenders, with a master lease model
12 that we're actually basing all of the loan interest off
13 of the Treasury Bill rate and the credit of the actual
14 city, we are actually getting interest rates between two
15 and a half to four and a half percent, depending on the
16 credit rating of the city.

17 And it's basically a no-nonsense load product
18 that -- but the Southern California Regional Energy
19 Center is working to try to come up with cash flow, a
20 cash flow positive energy efficiency projects and then
21 selling the business case to the city.

22 We're doing that in two ways. The first way is
23 through aggregated procurement. For example, we found a
24 lot of cities wanted to do VFD replacements on their
25 pool pumps. So what we did is, on behalf of all the

1 cities, created an RFQ, put it out to the market, and
2 then basically got tiered prices from vendors, also
3 dealing directly with the manufacturers saying, if we
4 bring you 100 customers how much will you charge us,
5 with installation, for this product.

6 Then what we do is we put pro formas together
7 based on all of the different short list of vendors and
8 we go around to all of the different cities that have
9 expressed interest, and now we have 20 cities right now
10 that are in the process, in some form or another, of
11 actually implemented full pump VFD retrofits through
12 their Local Government Partnership implementers.

13 We're just bringing the deal, helping them sell
14 it. We've got templates that are helping cities with
15 staff comments, specifications that they can put into
16 their own procurement documents, if they want to
17 actually get into contract.

18 Because we are bringing cash flow positive
19 energy efficiency, we qualify under Government Code
20 4217, which allows them to sole source our procurement
21 opportunities for them.

22 We're also doing whole building demonstration
23 projects on three properties right now, which we call
24 the SoCal REC audit, which is to take an ASHRE Level 2
25 audit and then add demand response, as well as renewable

1 energy and carbon offset gap analysis to the energy
2 efficiency to actually come up with potential income
3 sources, in addition to energy efficiency improvements
4 that could all be incentivized through the IOUs.

5 Final thing that we're working on is a
6 streetlight retrofit that the RFQ is just about to close
7 out on the market. And then we're going to be, again,
8 putting together a short list and we've got pro formas
9 where you can -- I'll finish in a second. Where you
10 actually have a cash flow positive where you could
11 retrofit your city-owned LS2s, LS3s with zero -- finance
12 it through our master lease agreements and you have zero
13 impact on your general fund.

14 We're actually taking some extra money to try to
15 put together an insurance plan so that it kind of acts
16 as guaranteed savings. So, if the savings aren't
17 realized, they can actually put a claim against an
18 additional loan loss reserve fund that we have.

19 So, I think it's really taken off and we're
20 getting tons of interest. We're doing presentations
21 right and left on this in Southern California, so we'll
22 let you know how it goes.

23 COMMISSIONER MC ALLISTER: Great, thanks very
24 much, really interesting stuff.

25 And I was going to ask about COGs, but I think I

1 won't, actually, at this point because I think that's a
2 good example.

3 I know ABAG has been working with many of the
4 Bay Area governments, but kind of in a different
5 capacity. And you know, SANDAG is kind of a unique
6 beast down in San Diego.

7 So, I think there's some unique models around
8 the State.

9 I did want to actually, you know, an
10 acknowledgement that Carol needs to leave at some point
11 here pretty soon, is that right, yeah --

12 MR. MC NAMARA: We've got about 15 minutes.

13 COMMISSIONER MC ALLISTER: Yeah, okay. But I
14 kind of wanted to talk -- so, let's see, we've talked a
15 little bit about, you know, examples and case studies,
16 and sort of the program area.

17 Also, George, I'm going to ask you to hang out
18 for just a few minutes.

19 MR. NESBITT: I'll be patient.

20 COMMISSIONER MC ALLISTER: So, I'm kind of
21 interested in the workforce, so the folks actually going
22 out there and doing the work. Right now, you know, it's
23 sort of no-man's land out there. And you have
24 contractors and you have lots of excellent contractors.
25 There's a lot of sort of diversity in the marketplace

1 and lots of different business models out there, some of
2 which, you know, are sort of more sustainable for the
3 individual employees than others, right.

4 I guess I'm interested in sort of if you could
5 point out or describe kind of a model that you would
6 say, hey, this company, and this apprenticeship program,
7 or this training program is really kind of the way it
8 ought to be done, or at least headed in the right
9 direction, you know, sort of real-world examples of kind
10 of, okay, here's the sort of right level of training at
11 the right moment for this particular market need.

12 And maybe give -- fill out that sort of -- you
13 know, our sense of that model a little bit, if you can?

14 MS. ZABIN: Well, I would give an example of
15 Marina Mechanical. Denny was here.

16 COMMISSIONER MC ALLISTER: Yeah.

17 MS. ZABIN: And you probably know Jim Hussey,
18 the President of that firm.

19 And their website is interesting because, you
20 know, they're what we would call a quality HVAC,
21 innovative, definitely into continual learning, and
22 emerging technologies, and educating the customer, and
23 kind of the things that we would like to hold up as a
24 good example.

25 And Jim was a -- he was actually not associated

1 with the State Certified Apprenticeship Program, and he
2 describes, and it's even on the front page of his
3 website, that he was chasing skilled labor and there
4 just wasn't very much of it outside of that
5 apprenticeship system.

6 And we're talking highly-skilled, five-year
7 apprenticeship in sheet metal and in plumbing pipe --
8 and pipe fitters.

9 So, for that quality commercial market or public
10 market there really is a system, and it is called the
11 State Certified Apprenticeship system. And it works
12 because the employers jointly get together in some
13 association, in his case SMACNA and the Mechanical
14 Contractors Association, and they all put in money.

15 And they don't have to chase each other's
16 workers because it is a multi-employer consortium.

17 So, structurally, it functions, and it also
18 functions from the worker's point of view because as
19 they get trained, they get paid better. And so they
20 make a career commitment, and so you see people working
21 30, 40 years in the industry from when they were very
22 unskilled, just high school grads to, you know,
23 whatever.

24 So, there may be variation in the individual
25 quality. I don't think we can hold up everybody who

1 belongs to that system, there's always going to be
2 variation. But I think the point is that there's a
3 structure that functions and it is a structure that is
4 really good at meeting code, because the employers are
5 in the compliant component of the construction industry.

6 There's a bit part that isn't compliant, right.
7 They're not so great and you can see why, at going
8 beyond code because they have to deal with the market as
9 it is.

10 So if, in your position, trying to push the
11 market, it's worth public investment to build off that
12 already very functional system and make sure that it's,
13 you know, pulling in and incorporating the emerging
14 technologies and, you know, going beyond code.

15 But that is the quality segment from a training
16 and skills point of view.

17 Now, it might not be the quality segment from a
18 marketing point of view, that's kind of the beauty of
19 CalCTP, it builds on that and then it says, okay, we're
20 going to train contractors in marketing because that
21 particular set of contractors, you know, they have been
22 more concentrated in the quality segments, in the public
23 sector where they just -- you know, and in
24 subcontractors to general.

25 So, they don't have to, you know, bid and sell

1 energy efficiency.

2 But from the workforce skills perspective, it's
3 not so much pinpointing, you know, a particular
4 employer, it's pinpointing the system that they belong
5 to.

6 COMMISSIONER MC ALLISTER: So, that system
7 attracted Denny. So, he wasn't aware of it and then he
8 became aware of it, and then he started contributing to
9 it?

10 MS. ZABIN: Right, and they joined it, they
11 joined it, yeah.

12 COMMISSIONER MC ALLISTER: Okay, right.

13 MR. NESBITT: They went union?

14 MS. ZABIN: They did go union. Now, you don't
15 have to go union. You can, you know, go through the
16 State certification process as a non-union employer;
17 it's not an exclusive system.

18 COMMISSIONER MC ALLISTER: Right.

19 MS. ZABIN: It is a demand-driven system,
20 though, and you'll get turned down if your market -- if
21 the investment has already happened, you know, it's like
22 you don't want to create a new CSU or a new UC if the
23 demand isn't there. And somebody's regulating that, and
24 it's the same with the State certified system.

25 Unless you can prove that there's demand that

1 the current programs aren't meeting, you won't get
2 certified.

3 COMMISSIONER MC ALLISTER: Okay, thanks, that
4 helps a lot.

5 And I'd kind of invite Bill to kind of give us a
6 similar kind of description of the ecosystem in which
7 the sort of -- the context into which, you know, the
8 workers that you're talking about kind of enter into and
9 what that looks like sort of functionally speaking.

10 And really, the goal here is to try -- so,
11 within the AB 758 proceeding to try to -- we know that
12 it's in the legislation, but we also know that it's just
13 in the water in Sacramento, right here, that jobs are,
14 you know, the number one issue and we need to make sure
15 that we're doing it justice, I think, in this
16 proceeding. And highlighting the benefits, and where we
17 can design the designing initiatives that we propose
18 such that they do actually -- it has the intended
19 economic and workforce impacts in the State.

20 So, I think it's really key to have sort of your
21 views on this.

22 MR. MC NAMARA: Well, one of the design
23 parameters of the ARRA program, according to the RFP
24 that was let, and according to ARRA in general, was to
25 get as much in addition to the creation of jobs, the

1 alignment with DOE, save energy, and at the same time
2 create matriculated economic benefit across a wide part
3 of the State.

4 So, when we looked at the design and I first
5 contacted the California Conservation Corps, we were
6 saying, okay, so we've got these young people, typically
7 between the ages and 25, looking to get into the job
8 market. They have typically very high unemployment
9 rates for that particular age group spread across the
10 State, and not really clear paths in many regards as to
11 how they would get into the energy efficiency industry.

12 So, what we did is we aligned that set of
13 resources, thinking of them as resources, as entry level
14 individuals into the job market on energy efficiency,
15 and took a look at all the work that was done in energy
16 programs, typically.

17 And then, specifically, this particular program
18 was focused on commercial retail, small facilities like
19 convenience stores, and small grocery stores, gas
20 stations, that sort of thing spread across the State.

21 Focused on, again, commercial refrigeration,
22 lighting, within LED lighting within refrigeration,
23 control systems for compressors, those sorts of things.

24 And so we put together a premise, which was that
25 the Corps members could be trained in a relatively short

1 period of time to go out, under a structured
2 environment, using technology-driven survey equipment to
3 gain the kinds of information that would be the first
4 steps of a stratification approach to a census, an
5 energy census for these particular buildings.

6 We called them surveyors. The intention was to
7 drive the opportunity index up, meaning get to a place
8 where we could let people know very effectively, on a
9 very personal basis, by having Corps members' outreach
10 program first, Corps members showing up, contractors,
11 these leading or following in that process, and at the
12 same time training the contractors in the same
13 environmental condition as the Corps members, with the
14 same types of people, on the same types of measures.

15 And the result of that was we found that they
16 actually dovetailed together really well, meaning the
17 Corps members established a great rapport. They were
18 multi-lingual, they could speak the same sorts of
19 language. They were from the same sorts of areas that
20 the stores typically were located in.

21 And they response from the communities was very,
22 very positive. There were some people, of course, who
23 didn't want to be bothered, but their number one
24 concerns by far were things that had to do with cash
25 flow. You know, the fact that they are an incredibly

1 under-served community relative to -- as business
2 owners, relative to the larger businesses.

3 So, many of them were unaware of what energy
4 efficiency programs there could be out there for them.
5 And, certainly, nobody had met with them personally to
6 do the math. You know, to basically show them how it
7 might work.

8 Or they were daunted by the process of applying
9 for financing for energy efficiency.

10 So, they needed some -- I hate to use the word
11 hand-holding, but they needed some very personal
12 addressment of these issues.

13 And so the Corps members, as new members
14 entering the workforce, were able to do direct installs
15 of economizers, and certain lighting things. They were
16 able to do the marketing side of it and establish, you
17 know, really good personal relationships with the store
18 owners and ratepayers. And then also do the post-
19 install checks.

20 So, as I mentioned before, there's a compression
21 that's occurring in the workforce. First of all, a lot
22 of the workforce is transferring out. They may be
23 retiring, they may be doing other things. The
24 technologically driven demands for education levels and
25 experience are increasing. A lot of the programs are

1 more complex.

2 There are a number of factors that are creating
3 cost and efficiencies in programs. I know this having
4 run many of these programs in the State of California
5 and elsewhere.

6 That in many cases the cost of individuals that
7 are actually billed to programs are not necessarily the
8 costs that could be build.

9 And I don't mean any falsification, I mean
10 simply that an individual that may be at a certain
11 compensation level, a certain skill level may be doing,
12 you know, 80 percent of their work at that level and 20
13 percent at some level that could be done by some other
14 person, which represents a workforce development
15 opportunity for stratification of work.

16 And so those approaches have been very
17 successful. The program was developed as a pilot
18 program under the ARRA auspices, the intentionality
19 being that there would be something that follows which,
20 by the way, there is, which you'll be seeing fairly
21 soon. I should say coming to a theater near you.

22 But there is a lot of latitude in the workforce
23 for decompression of cost-based, cost-driven
24 opportunities and stratification into work that's more
25 fit to finish in terms of who can do what sorts of work

1 and, arguably, more effectively in some cases than some
2 of the more traditional experienced professionals.

3 COMMISSIONER MC ALLISTER: Great, thanks.

4 Thanks very much, I appreciate that.

5 So George.

6 MR. NESBITT: George Nesbitt, thanks.

7 I'm going to start on the workforce, you had a question,
8 and then maybe I can come back to whole house a little
9 later.

10 COMMISSIONER MC ALLISTER: Three minutes, man.

11 MR. NESBITT: I just --

12 MR. ASHUCKIAN: I want to thank Carol for her
13 time.

14 COMMISSIONER MC ALLISTER: Thanks Carol.

15 MR. NESBITT: I just realized that after 26
16 years in the trade I am about the average age of a
17 carpenter in the industry. Scary thought.

18 I started non-union, no training, got a job.
19 You essentially work, learn on the job, learn as you go.
20 I mean I was a heavy reader I'd, you know, take
21 lectures, I'd read books, magazines, a self-learner.
22 Moved up, actually went to work for myself quite early.

23 You know, absolutely we need to get into the
24 union apprenticeship programs and teach stuff right
25 there.

1 Unfortunately, unions are a small part of the
2 labor force and have been declining. The bulk of the
3 industry is non-union, non-trained, which is one of the
4 big problems. And there's certainly a big cost
5 difference between union labor force and non-union.

6 But we need to get into the universities, you
7 know, we need to get into the design professionals, we
8 need to get into all the schools, into the junior
9 colleges.

10 I'm on the Board of Passive House California,
11 and the lawyers are denying the junior college students
12 the benefit of a real Passive House Project retrofit
13 over liability. They've only done like eight projects
14 in 20 years.

15 And, yet, I know from my involvement, you know,
16 with the junior colleges, I know in the environmental,
17 the HVAC program, you know, that the instructors don't
18 necessarily know the ACCA standards and the various
19 things. They're not necessarily teaching what we know
20 is best or, actually, even what's code because much of
21 that is in the code. It's, you know, minimum industry
22 practice and/or manufacturer's recommendation.

23 And so workforce training's absolutely vital.
24 You know, one of the jokes we've had in the HERS rating
25 industry is, well, with ARRA there was a lot of money,

1 there was a lot of people trained and there were no jobs
2 for them. So, you know, we can train people but there's
3 got to be jobs for them.

4 COMMISSIONER MC ALLISTER: Well, that's kind of
5 why I'm asking, actually, exactly that question, really
6 is when Carol describes this program and they get people
7 trained, where do those people go? What is the
8 commitment, what is the nexus between the industry and
9 those trainers?

10 And similarly with Bill, like when you put
11 together a program you're producing a certain level of,
12 you know, employee worker that's got a certain level of
13 experience what -- you know, how do we ensure that that
14 fits in with the needs of the marketplace?

15 And, hopefully, that can be a growing
16 marketplace. If we're successful in this program then
17 that will be a growing marketplace, and we'll have lots
18 of slots for different levels of folks to fit in, and
19 then have some professional development associated with
20 that.

21 So, that's really kind of the whole reason that
22 we wanted to have this discussion is so that we can talk
23 about programs, talk about workforce and see how they
24 fit together, and whether there are gaps we can fill
25 with the 758 proceeding.

1 So, I ended up taking up a little bit of your
2 time but --

3 MR. NESBITT: No, that's quite all right. If I
4 understand right, in the apprenticeship programs you
5 have to -- it's a job and an apprenticeship. So, if
6 you're not employed, you're not an apprentice. So, in
7 that sense as long as your job is viable, it's okay.

8 But, you know, when we get to junior colleges,
9 when we get to Rising Sun, we get to a lot of these
10 workforce development, especially with the younger, the
11 unemployed, the people that have had issues there isn't
12 necessarily jobs.

13 And, you know, then we're struggling with trying
14 to grow this market and there isn't necessarily -- those
15 jobs aren't necessarily there yet to move them into it.
16 But, you know, it's the chicken and the egg.

17 MR. MC NAMARA: Well, I couldn't agree more in
18 the sense that -- with both comments, in the sense that
19 training someone to do something and upon the end of
20 that process there not being any jobs available is a
21 rather counterproductive thing.

22 It creates a number of issues for the people who
23 give the training and also the people who receive it.

24 So, one of the things that we've been focused on
25 is to, whether it's in a formal, California State

1 approved apprenticeship program, or something that is
2 not that but it is similar to, is to make sure that the
3 people that are being trained actually receive a wage.
4 Meaning they do a day's work and they receive a day's
5 wages for that work.

6 And that the training process, itself, is not
7 just theoretically, meaning it contains all the theory
8 that's necessary, but it's a practical, hands-on type of
9 thing, pretty much the working definition of
10 apprenticeship from the old days.

11 And so apprenticeship programs need to have an
12 avenue, they need to have a purpose, they need to have a
13 value proposition that's associated with that, that's
14 communicable, understandable and acceptable, and has
15 some kind of utility by whoever the recipients would be
16 for that.

17 So, apprenticeship programs in the past often
18 were tied directly to unions, for example, where they
19 would have a union organization focused on sheet metal,
20 or piping, or whatever that was, and people would be
21 brought in under the union auspices, trained by union
22 auspices, and perhaps also by third parties, and then
23 deployed. You know, hired in and actually having work.

24 But they weren't necessarily all employed at the
25 time of their training.

1 So, it's much like the problem that small
2 businesses have in terms of not being able to finance
3 energy efficiency measures, many of them, from a cash
4 flow stand point. You can sit there and show them that
5 the thing pencils out in two months, a return on
6 investment, but they'll look at you and say, well, I
7 don't have that money to offset what's not covered by
8 incentives, if there are incentives. So, therefore, I'm
9 not going to do this thing.

10 There are ways to overcome that from a value
11 stand point.

12 But on the human side of the equation, when
13 you're training people and then deploying them into
14 opportunities, there has to be some sense of measured
15 success, and hope, and opportunity for them in order for
16 them really to perform at their full potential.

17 One of the great things that the California
18 Conservation Corps does is it brings opportunity to many
19 young people, who aren't actually employees of the
20 State, but they're participants in a program. And as
21 such they do a day's work, they get a day's pay.

22 And they learn something. They continue their
23 education in general, meaning if they don't have high
24 school diplomas or whatever level of education, they're
25 actually required to continue that education as a member

1 of the Conservation Corps.

2 When they work on specific projects, like this,
3 they actually are employed on that work. I mean they
4 are deployed -- trained, deployed and have a future.
5 They build resume potential, meaning they actually have
6 something to put in their resume. They actually gain
7 financially during that period of time.

8 They gain credentials, in many cases stackable
9 credentials, so that they become a much more marketable
10 entity.

11 And perhaps most important, in the process of
12 working on one of these programs, they're exposed to
13 literally hundreds of potential employers, often.

14 Now, the employment that they get may not
15 actually be tied directly to the result or the thing
16 that they're trained to do. But, nevertheless, that
17 training was valuable to them and they may very well
18 move on.

19 Many of the people from the Energy Smart Jobs
20 Program went on to work for contractors directly. Some
21 went other places, as well.

22 But the key is to create a value proposition
23 that's strong enough so that it's not false in the
24 beginning. Meaning, they're not just getting training
25 for something that in theory should work. Rather, they

1 should be getting training and then deployed into actual
2 work associated with that so they have the credentials,
3 they have the practical experience, work experience, and
4 then they have something that's marketable, that can be
5 acknowledge by potential employers as a marketable set
6 of skills.

7 Sorry for the length of that.

8 MR. REGNIER: No, not at all. I just appreciate
9 the response.

10 I had hoped to speak a bit to a subject that all
11 three of you guys can speak to with a bunch of
12 authority, but addresses attention between the comments
13 we had with Derrick and with Bill.

14 One of the things that you were discussing,
15 Bill, is the need to set expectations properly such that
16 if we're not able to get to all efficiency measures in
17 the first set of programs, that the expectation is well
18 founded that we can have access to that marketplace
19 later to continue the work.

20 One of the things that Derrick said and that
21 I've heard very much over the last couple of days in the
22 residential and light commercial sector, is that the
23 cost of the retrofit is not nearly as much a factor as
24 the cost of the hassle associated with the program, with
25 the retrofit.

1 In terms -- I'd like to hear, specifically, the
2 ideas that you have on how to address that tension.
3 There's no way of having a multi-touch program that
4 doesn't have some hassle associated with it, but it
5 would seem that there's a very specific set of elements
6 or perhaps skills that are going to be necessary to
7 thread that needle.

8 We've had some -- unfortunately, we didn't have
9 Mark here to speak to that, but he's also spoken quite a
10 bit to the sales aspect of it.

11 You know, you've got an enviable conversion rate
12 and enviable smart jobs, and I would assume that some of
13 the elements that you've had there would be elements
14 that were required, but I'd love to hear you guys'
15 opinions on it.

16 MR. REBELLO: So, again, thinking about the
17 small and medium business sector, which I think is the
18 target --

19 MR. REGNIER: Uh-hum.

20 MR. REBELLO: -- and trying to be comprehensive.
21 As I said earlier, the direct install model is the one
22 that seems to work best. I mean people don't have time
23 to thumb through a website, fill out applications.

24 Within that there are really two types of direct
25 install programs. There's sort of a general contractor

1 model where somebody goes in and they do the audit, and
2 they look very comprehensively, and then they've got a
3 pool of contractors that they'll bring in, if it's
4 refrigeration, in addition to HVAC, or electrical, et
5 cetera.

6 The other is more of a contractor-driven model,
7 where the contractors are trained and then sort of armed
8 with rebates, and they'll go out and sell the jobs.

9 Our experience is you don't get the
10 comprehensiveness that one would like under that
11 contractor-driven model.

12 And the main reason is a lighting contractor is
13 going to do the lighting job and until the return to
14 them of selling an HVAC project is equal to selling
15 another lighting project, they're not going to do it.

16 So, as much as we would hope and we thought we
17 could train them, it doesn't work.

18 And so looking at more of an auditor going in,
19 taking a more holistic approach -- and what we're doing
20 with one of the Local Government Partnerships is we're
21 taking that holistic approach, we're selling what we
22 can, what the customer has an appetite for, and then
23 we're holding the rest of it sort of back in reserve.

24 And the goal is to continue to follow up with
25 them and say, hey, look, the lighting project seemed to

1 go pretty well, you're saving some energy, what about
2 doing that refrigeration project we talked to you, or
3 maybe at this point there's a new program that we can
4 tap them into.

5 But collecting that data and continuing to
6 follow up with I think is pretty critical.

7 MR. MC NAMARA: So, I would argue that setting
8 the customer expectation is the most important thing to
9 do and it doesn't matter really the topic, but in this
10 particular case energy efficiency.

11 So, in showing up at a store location, for
12 example, to use commercial retail as an example, in many
13 cases, as I mentioned, some of the smaller facilities
14 had not actually been directly approached by energy
15 efficiency programs other than, perhaps, they've
16 received something in the mail or perhaps a telephone
17 call.

18 But to have somebody actually show up in person
19 to see them, that wasn't directly selling them
20 something, but rather there to explore the opportunities
21 of that particular facility and then tell them what that
22 might mean to them, and how that could be beneficial,
23 and help them understand how to navigate the process
24 with the utilities, or whatever other factors were
25 involved is a powerfully strong statement to that

1 particular store owner that they're important.

2 You know, first of all they matter, and they
3 really do. Look at the numbers this morning, how many
4 small businesses are there in the commercial, in the
5 nonresidential side, right? There are -- that's the
6 largest number.

7 And some of the energy density in those small
8 facilities is actually amongst the highest of building
9 per square feet. Refrigeration being a great example,
10 which is one of the reason why the ESJ program focused
11 on commercial refrigeration.

12 But setting that expectation requires delivering
13 more than just telling them about the opportunity, but
14 the commitment to follow up, the ability to help steer
15 them to recommended contractors, if that's the
16 particular program aspect.

17 But more importantly to tie together whatever
18 may be available so they can actually connect the dots
19 as to how to leverage not only the thing that they're
20 doing, but this concept of whole building as a continuum
21 of engagement and a continuum of energy efficiency
22 improvements. Not, you know, hit and run type
23 activities wherein people show up only to harvest the
24 most available type of thing at the highest profit
25 level, if it's a for-profit organization.

1 Those are the kinds of things that build, that
2 set expectations really positively and build positive
3 relationships between the customer and not necessarily
4 with the particular utility, or the particular program,
5 but with the idea of having energy savings as a
6 beneficial thing to them and an important aspect of the
7 way they think about doing business.

8 Because at the end of the day they're in
9 business to do business and so the value proposition has
10 to be made contextually real enough, and set the
11 expectation that it doesn't have a start and an end.

12 Because even if we did a whole building, if I
13 went there and did a real formal audit, and came back
14 with all the recommendations that they could do in that
15 building three months from now a new technology comes
16 out, or another kind of incentivization where we didn't
17 consider some aspect of the building envelope comes out,
18 or they have a failure of equipment, or they have --
19 there are many, many possibilities.

20 We don't want them, we would be ill-advised in
21 our engagement with customers to actually make a
22 condition where they thought there was a stop point to
23 it. And that's what a lot of programs do, they show up
24 as a singularity, the person participates in it, and
25 then later on they're surprised that there's something

1 else.

2 This is not a brilliant approach to energy
3 efficiency, in my opinion.

4 MS. OLSEN: I'd just like to add on I
5 wholeheartedly echo everything Bill just said.

6 Just to talk a little bit about it, our approach
7 is to really look at where the customer is, use the
8 information we have about the customer from segmentation
9 and all the information we know, try to understand where
10 that customer is along their journey. Had they been
11 engaged before, is this their first engagement, what are
12 they ready for, and understand their needs, present it
13 in their needs and as a step along that journey that
14 will continue.

15 Also, we're looking more closely than I think we
16 have in the past at designing what the customer
17 experience is, what the entire process for the customer
18 is in participating in the program, applying for or
19 receiving the incentive or the rebate.

20 And, particularly, looking very closely at SMB,
21 trying to understand are there segments where we don't
22 have enough opportunities for them to participate, and
23 designing some products that are simple, easy, you know,
24 don't have the big hassle factor.

25 Then wanted to just also comment on the direct

1 install models, that we've looked pretty closely at
2 those and are looking at making them -- have redesigned
3 direct install for the majority of the programs that are
4 going to be in the next cycles, so that they are more
5 comprehensive, working on making sure that when they get
6 to that customer site that they're doing more than just
7 lighting, that there are opportunities to coordinate,
8 collaborate with other contractors who might have
9 different skill sets.

10 COMMISSIONER MC ALLISTER: Thanks a lot. I
11 guess, do we have some blue cards over there?

12 MR. ASHUCKIAN: Yeah, we have a couple more,
13 actually. We have two questions from the web, Tracy Von
14 Lone, from Glumac, has a question regarding how Smart
15 Meters -- how Smart Metering will help overcome the
16 barrier to achieving upgrades in small, noncommercial
17 buildings. I mean, I'm sorry, small, nonresidential
18 buildings.

19 And then we have Cheri Davis from SMUD, who has
20 a question as well.

21 And then the last question from Tracy on,
22 actually, one of our "bonus questions" at the end of the
23 agenda, and that is, "How penalties for building owners
24 for noncompliance on regulations, particularly AB 1103
25 would be handled?"

1 MS. OLSEN: So, I can address at a high level
2 the question about Smart Meter. I think, kind of as I
3 tried to lay out in my seven minutes on whole building,
4 that if you can use the Smart Meter on the -- for the
5 kind of the pre-measurement and the savings verification
6 you can get around some of the intensive sub-metering,
7 engineering, et cetera, which adds a lot of costs, which
8 then means it's lengthy, it's complicated, and maybe not
9 worth it to do that project for a smaller business,
10 where the savings opportunity isn't as large.

11 So, that's one of the big benefits.

12 MR. REGNIER: Sounds like we've got consensus.

13 COMMISSIONER MC ALLISTER: Cheri?

14 MS. DAVIS: Hi, I'm Cheri Davis from SMUD. And
15 I wasn't sure if this was going to be an appropriate
16 topic, but since we were talking about hassle factor and
17 SMB, I thought I would just bring this into the
18 discussion.

19 So, first, just a little bit of history. SMUD's
20 programs for SMB historically have been very widget-
21 based and contractor-driven.

22 And I'd like to echo the comments you made
23 earlier, Derrick, that contractor-driven really
24 doesn't -- doesn't get you what you want. It doesn't
25 get comprehensiveness and, basically, the contractor

1 does what's best for the contractor, not what's best for
2 the customer.

3 And so with the help of ARRA funds this -- well,
4 I guess this was about two years ago, now, we started a
5 program called Complete Energy Solutions, which is a
6 more comprehensive approach. I wouldn't call it whole
7 building because we're not addressing things like
8 insulation, but it is addressing lighting, HVAC,
9 refrigeration, controls all at the same time.

10 And we have a program administrator that's going
11 out and conducting the audits, and they're making the
12 recommendations, and the contractor does the
13 installation.

14 Starting next year I think we'll move towards a
15 more direct install approach to the same program.

16 But one of the biggest problems we have in this
17 program and the biggest break point we've had is on the
18 permitting side.

19 For this program we decided to basically police
20 permitting. In other words, the program administrator
21 is required to get a copy of the permit.

22 And we did this for a variety of reasons, it's
23 something we haven't done in the past. And surprise,
24 surprise, this caused a lot of problems.

25 And in our other programs, in our contractor-

1 driven programs we've always told the contractor you
2 have to comply with the law, you have to get all
3 necessary permits.

4 Well, the fact that they were complaining so
5 loudly when we started policing it tells us they weren't
6 getting those permits.

7 (Laughter)

8 MS. DAVIS: And so that was a little bit of --
9 that was kind of dismaying.

10 But then in reality, when we watched the program
11 deal with this issue, it's a huge problem because the
12 contractor, for a small job, large job, it doesn't
13 matter, they have to go to the city or county, they have
14 to wait in line, they have to provide a to-scale drawing
15 of their project, they have to pay the fee, they have to
16 set up an appointment, they have to wait at the job site
17 and all of this for something like an occupancy sensor
18 wall switch?

19 I mean this -- it really -- I don't really even
20 know how to do a direct install program when you have
21 those kinds of barriers.

22 And we've tried to streamline the process a
23 little bit with Sacramento City and Sacramento County,
24 but there's only so far we've been to go.

25 We've tried a lot of, you know, what if we did

1 this, and what if we did that, and what if our program
2 administrator acted as the -- acted as, basically, the
3 inspector, what if we trained them? Well, no, there's
4 labor issues.

5 And so we haven't been able to overcome that
6 barrier. And for true whole building retrofits maybe
7 this is not such a big deal because these are going to
8 be really big projects. But for a program such as ours,
9 which I think is still good, maybe not best, but good,
10 you know, I think it's a big barrier that needs to be
11 addressed.

12 And I don't know if it's something that the
13 Energy Commission could address, or I don't know, maybe
14 you have some comments along those -- how to solve that
15 problem or what you've experienced, or any
16 recommendations?

17 MS. OLSEN: I think I have to unfortunately say
18 this is not an area that I am very well versed in. So,
19 I've heard the same concerns and I think it's a rich
20 area for discussion.

21 MR. REBELLO: Well said, yeah.

22 MR. MC NAMARA: So, I would add only that in
23 some -- this is a perennial problem, so contractors, I
24 think, it would be fair to say not all contractors, as
25 has been said, actually pull permits before work is

1 done.

2 Most programs actually have language in their
3 agreements that say it's up to the contractor to make
4 sure that they have the appropriate documents before
5 they do the work.

6 But unlike in the case of SMUD, that you
7 mentioned, the programs don't actually police that
8 condition, nor have the utilities in general.

9 So, how to get past some of that in the most
10 positive sense, legitimate sense, so in some cases
11 direct install programs can do things that are not
12 actually alterations to the physical wiring or the
13 building.

14 For example, an economizer, which is of the type
15 for, say, an internal refrigeration device is something
16 that plugs in the wall and you then plug this small
17 refrigeration thing into it.

18 And so there are things that can be done on a
19 direct install basis, legitimately, without violating
20 any permit process.

21 But beyond those things, direct install
22 programs, if they really are going to be compliant, will
23 need to have ways to address the permit issue, and very
24 few entities have stepped up to the plate to want to
25 actually police that, and "police" being in quotes.

1 MR. REGNIER: Just as a follow on, to what
2 extent do you find that difficulty shaping the design of
3 your programs?

4 It sounds as though you've got some measures
5 that are outside of the boundary of that which must pull
6 a permit. So, either one, if you'd like to go first.

7 MR. MC NAMARA: So, having designed many energy
8 efficiency programs in large commercial from whole --
9 you know, large building commissioning, to industrial,
10 to residential commercial, I can say that without
11 exception all of them have that language I refer to, but
12 none of them have the -- either authority or the
13 intentionality of determining that condition.

14 In fact, the most that I've seen done has been
15 to extend to subcontracted relationships, for example a
16 program may very well have a contractor participation
17 model, and for the contractor to sign up they have to
18 sign up to a certain level of agreement, so it's almost
19 a pass through.

20 So, we say that work done under the program will
21 be under, you know, all applicable local laws and
22 statutes.

23 The transference to the subcontractor includes
24 the same language and that's about as far as it goes,
25 meaning it's a very well-understood condition, I think

1 by virtually any program that isn't done directly,
2 perhaps, by an energy efficiency company and, therefore,
3 under the same sets of standards and liabilities, that
4 that pass-through condition is the norm.

5 MR. ASHUCKIAN: Okay, we have one more request,
6 Sean Layerle, from TRC Solutions.

7 MR. LAYERLE: Good afternoon, my name is Sean
8 Layerle, with TRC Solutions. We're an environmental
9 engineering firm and we have business throughout the
10 United States.

11 I'd like to thank the Commission and the day's
12 panelists for a very insightful forum.

13 I have a question for Jenna, but I'd also love
14 to hear perspectives from the other panelists and,
15 perhaps, from the Commission as well.

16 We've worked with a lot of energy efficiency
17 programs throughout the United States. And with regards
18 to pay-for-performance type programs a lot of states,
19 and a lot of utilities in other states have programs
20 that actually require a significant portion of cost
21 sharing, not just for the implementation of measures,
22 but also for the study work that actually goes towards
23 identifying measures or the technology. Monitoring
24 technology, for example, that seeks to identify
25 measures.

1 They might also require an up-front commitment
2 for a budget towards implementation of measures, so
3 there's a lot more skin in the game for customers before
4 any of the program work begins.

5 Whereas in California it seems that the worst
6 case scenario for a customer, in participating in an
7 energy efficiency program, is the status quo, and so
8 there might be a little bit less incentive for customers
9 to move forward with implementation of a project.

10 Whereas in other states they know up front that
11 the worst case scenario might be that they're out
12 \$30,000, or \$10,000 or what have you.

13 MS. OLSEN: So, if we're talking about programs
14 with large customers, we do have certain program models
15 where maybe the customer will get an audit for free.
16 But then if they don't follow through then they would
17 have to -- they sign an agreement saying that they would
18 pay for the cost of that audit.

19 And then there are, even in some of the direct
20 install programs with the smaller customers, there is a
21 co-pay involved so that there is some skin in the game.

22 MR. MC NAMARA: And it's my experience, as well,
23 across many different market sectors that the vast
24 majority of the programs require, and the utilities in
25 particular, through their determination of the amount of

1 incentivization, the percentage possible, make sure that
2 there is some customer skin in the game.

3 There are exceptions to that, but many programs
4 do require that.

5 The timing of that, I think to your point, is
6 fairly crucial. So, if the customers are required to
7 make payment before work begins, or before the rebate
8 processing occurs, or if they can't bundle that all
9 together in some fashion that they think is reasonable,
10 then the uptake of the program is diminished, speaking
11 here in California, but I also run programs in other
12 states, too.

13 So, it is to a large extent based on the way --
14 "the way things are." I mean in certain states, in
15 certain environments the kinds of programs that
16 available and the ways in which people participate in
17 them may be slightly different, especially relative to
18 the percentage of incentivization, the timing of
19 incentivization and the way the rebate processes
20 actually flow.

21 MR. ASHUCKIAN: Okay, with that I think we're
22 going to have some closing remarks from the
23 Commissioner.

24 COMMISSIONER MC ALLISTER: No more blue cards,
25 no more questions?

1 MR. ASHUCKIAN: There's no more blue cards.

2 COMMISSIONER MC ALLISTER: Okay, great.

3 MR. ASHUCKIAN: There was the question regarding
4 1103.

5 MR. REGNIER: Yeah, it's one of the bonus
6 questions. It's a very quick answer. The question was
7 what enforcement is the Energy Commission planning on
8 putting in place to enforce the regulations that are
9 implementing AB 1003, which is Nonresidential Building
10 Energy Use Disclosure.

11 And the brief answer is that by virtue of having
12 the disclosure be a required part of a business
13 transaction, that brings into play just a lot of the
14 established contract law and fraud statutes, willful
15 misrepresentation and that sort of thing.

16 If anybody would like, I don't have in front of
17 me all of the code sections or the specifics, but the
18 short answer is a lot of it's going to take care of
19 itself just because the disclosure's going to be a
20 mandated part of a transaction.

21 And in order to be legally binding, all of the
22 mandated parts of a transaction must be present.

23 COMMISSIONER MC ALLISTER: Actually, one
24 question on that. So, I guess, is there any sort of
25 infrastructure support, anything like that, that the

1 Energy Commission would be appropriate to bring to that,
2 to sort of ensure that the disclosure happens in the
3 most effective way possible?

4 MR. REGNIER: We certainly have the legal
5 capacity to do so.

6 The statutes that regulate commercial
7 transactions, fraud, willful misrepresentation and the
8 like, are pretty well established law and have pretty
9 mature venues for being carried forward.

10 COMMISSIONER MC ALLISTER: Well, I guess I'm
11 thinking like does -- and I'm not -- I haven't read 1103
12 and haven't look a lot at -- I should, but I haven't
13 looked a lot at what the materials are that have been
14 developed already, and how that implementation process
15 is going.

16 However, if there were, for example, a standard
17 format or something like that, that we could pitch in
18 and develop, potentially as part of this proceeding,
19 that would enable sort of that mechanism, the disclosure
20 requirement to be -- to be taken full advantage of,
21 let's say, from an energy efficiency point of view, or
22 just from sort of a consumer point of view, then we
23 could consider that at least.

24 MR. REGNIER: Certainly. And one of the
25 positive elements of how the statute was put together is

1 it's very specific. And due to that specificity we've
2 come up with a number of very well defined and very
3 well-articulated elements as to what consists -- or what
4 a disclosure consists of. And those are articulated
5 very clearly and unambiguously in the regulations
6 implementing.

7 COMMISSIONER MC ALLISTER: Great. Thank you.
8 Good answer.

9 MR. REGNIER: I've read it a few times.

10 COMMISSIONER MC ALLISTER: Yeah, I bet you have.
11 Thanks Justin, I appreciate it.

12 So, we're pushing five o'clock and I don't want
13 to make a lot of closing comments, except to just really
14 thank everyone for coming.

15 First, I want to thank staff, actually, because
16 I have found this two days to be incredibly positive and
17 energizing. And, really, it makes me excited to sort of
18 roll up my sleeves and help keep this ball moving
19 forward.

20 I think we've got great staff on this. We're
21 going to look at bringing the right amount of resources
22 to the right -- to each of these topics.

23 And, you know, the right expertise to make sure
24 that we're engaging the different sectors of the
25 marketplace and the stakeholder groups.

1 You know, one thing we're going to have to think
2 about is on the sort of working groups or the support
3 groups that we form for -- to carry implementation
4 forward, you know, we're not going to just sort of sit
5 back here behind the curtain and twiddle knobs and come
6 up with a solution, right.

7 It really has to be a collective effort, so
8 primarily with the PUC and other State agencies at that
9 level to make sure that we're on the same page and
10 working towards the same ends.

11 But also with the broader stakeholders on each
12 of these topics, nonresidential, residential, if that's
13 the right way to parse -- it may not be, we may want to
14 talk about, you know, have a data group and have a tools
15 group, et cetera, et cetera.

16 So, you know, always the tradeoff is trying to
17 do it efficiently, with the right level of formality,
18 because the more formal we get the more kind of
19 administratively burdensome it gets but it also -- that
20 may have some validity in some sense, so -- or some
21 usefulness.

22 So, you know, informal can also work where we
23 sort of -- ad hoc, you know, when we need that expertise
24 and we're at a critical point we call the group in, or
25 we have a WebEx or something like that.

1 So, we're still sort of really beginning to
2 figure out sort of what that looks like going forward.
3 And any suggestions that folks might have for that would
4 be more than welcome.

5 But again, I think at the beginning I said I
6 think this is incredibly important and could have a huge
7 impact on our State for generations, and I think that
8 that is very true.

9 And so it's a big lift and it's really a good
10 thing we're doing here in the room.

11 So, specifically, I want to just call out
12 Christine. Probably many of you have talked to her.
13 She's going to step back into the room to get out of the
14 way.

15 No, she deserves a lot of kudos here, as do the
16 rest of the staff on the case here, Bill, Martha, I see
17 Craig there, I see different folks, different staff is
18 here. Justin and, let's see, Devi who ran a panel.

19 I'm going to leave a bunch of people out so I
20 guess I won't try to -- Adrian there, yeah, behind the
21 laptop there.

22 So, anyway, we got a good -- and Dave Ashuckian,
23 who's sort of the fearless leader of that team.

24 So, I think, you know, we're on the same page
25 and really working towards the same goal, and so I'm

1 really encouraged by that.

2 And together, with the PUC as well, I want to
3 thank the PUC. I see Bruce over there.

4 Really, really I'm encouraged in a lot of
5 different ways. I think there's a lot of goodwill and
6 collaboration in the room and we want to keep it that
7 way.

8 Let's see, so there are a lot of individual
9 topics I could bring up, I'm not going to do that. I
10 think we're all well tapped out after two days of pretty
11 intense conversation.

12 I find my limit on this sort of thing, being
13 over-stimulated for two days is about all I can take.

14 And I think we got a lot of good foundation
15 and --

16 (Interruption by WebEx Operator)

17 COMMISSIONER MC ALLISTER: No, please, don't
18 reconnect, don't connect.

19 MR. ASHUCKIAN: We didn't want people to miss
20 the very end.

21 COMMISSIONER MC ALLISTER: Well, yeah, okay,
22 great.

23 But, you know, there are a lot of individual
24 topics that really will require heavy lifting, and a lot
25 of digging and, you know, construction of new tools that

1 are going to enable us to get the result efficiently and
2 effectively, and learn from what we're doing.

3 So, we've talked about a lot of those things
4 today and I'm sure in comments and in the, you know, the
5 working groups that we may choose to convene going
6 forward, the draft action plan, and then the events or
7 the workshops that we'll hold around the State, which I
8 think will be very interesting.

9 I mean, we definitely are not going to do them
10 all just here in Sacramento, we're going to try to get
11 around the State, so we have to plan that out and figure
12 out what's doable and what's worthwhile.

13 And then the final action plan is really going
14 to be a document that directs policy in the State in
15 very important ways. And so we'll want to structure it
16 to be as relevant as possible and as impactful as
17 possible.

18 So, we're going to need all your help, and all
19 the folks who have been listening in and attending over
20 the last couple of days, and beyond, to make that
21 happen.

22 And, definitely, the CPUC and staff are going to
23 be co-partners in that.

24 So, with that, I think I want to -- Dave?

25 MR. ASHUCKIAN: Well, I just wanted to just

1 remind folks that written comments are due on the 23rd.

2 COMMISSIONER MC ALLISTER: Okay.

3 MR. ASHUCKIAN: There is information in the
4 notice about the docket, how you submit to the docket.
5 And we encourage you to be specific. You know, tell us
6 exactly what you think we should be implementing and
7 encourage you, again, to provide written comments.

8 If you want to direct those comments to specific
9 questions that are in the agenda, that's great as well.

10 COMMISSIONER MC ALLISTER: I would also point
11 out that, so apart from the questions that were attached
12 to individual panels, there are several questions --
13 let's see, seven questions it looks like at the end,
14 that are just additional questions.

15 And, you know, issues like non-energy benefits,
16 like financing, some of the issues that really the
17 primary discussions are happening over at the PUC, and
18 they're the ones that are really digging into these, we
19 didn't want to overlap too much, but we wanted to make
20 sure that we were sort of cross-pollinating.

21 So, folks with the appropriate expertise and
22 sort of willingness to dig into those issues are more
23 than welcome.

24 And those questions were not -- we didn't dig
25 into those these two days but, still, they're very
