I am writing this letter to ask you to please consider alternative ideas for DRECP to consider regarding renewable energy, not solar fields in our beautiful rural area.

We have many large shopping centers, college, schools that will accommodate solar on their roofs. Before any solar fields are created I feel all other options should be identified and used to protect the lands.

Another huge issue all of us need to consider is the water usage needed for the solar fields. We are currently in a drought throughout most of the country and should not or cannot waste any water.

I moved out here from Burbank twenty years ago to spend the rest of my life in a peaceful, scenic and restful environment. I do not want solar fields flashing in my face or taking away the beauty of the landscape. I gave up all the amenities of living in a large city when I relocated to this area and don't want the city folks to think they can just come out here and ruin our landscape, take our water, pollute the area, they don't seem to care at all about what "we the people want".

I know for a fact the terrible issues residents have when the ground or land is scrapped clean. Our area has high winds often and all it will create is a terrible sand storm where visibility is restricted or totally gone. I or others certainly do not want to breathe the tiny particles and contaminates that will be blowing in the wind.

I am totally against any large commercial solar farms going into any rural or residential area. Why not get the roof top solar onto the huge buildings first and see then if we still need more energy.
